

7. ESG disclosures

Tables 1, 2 and 3 - Qualitative information on Environmental, Social and Governance (ESG) risk

Basis of preparation

This disclosure is prepared based on the Sustainability statements in our Integrated Annual Report 2024. Results of our double materiality assessment (DMA) constitutes the backbone of the disclosures.

Our materiality assessment

We conduct multiple materiality assessments, each serving distinct yet interconnected purposes. These include:

- the Integrated Reporting (IR) materiality assessment,
- the European Sustainability Reporting Standards (ESRS) materiality assessment,
- the European Central Bank (ECB) climate-related and environmental risks (CER) materiality assessment as integrated in the Enterprise Risk Management framework.

Each of these assessments has its own specific methodology, which we explain in detail below. This year, the ECB Guide CER materiality assessment has been integrated into the ESRS materiality assessment. To advance our ESG risk management practices and comply with the expectations of the ECB Guide on CER we made many improvements in 2024, for example in the Environmental and Social Heatmaps, the CASY tool for client assessment and the risk appetite framework.

The 2024 CER materiality assessment results fed into the double materiality assessment as financial materiality input.

Time horizons

We assess material impacts, risks and opportunities over the short, medium and long term. The short term refers to the reporting period of the Annual Financial Statements. Since sustainability-related matters often materialise over longer time horizons, the nature of these topics warrants more forward-looking reporting, whereas financial information is related to the annual reporting period. For forward-looking information on ABN AMRO's material impacts, risks and opportunities in the Sustainability Statements, ABN AMRO defines:

- 1 year as short term
- between 1 and 5 years as medium term
- more than 5 years as long term

Where our time horizons deviate from these general guiding principles, this is disclosed alongside the specific material topic.

Scenarios

The assessment was performed against our global base case scenario, in which a large group of countries make systems changes with a view to decarbonising their economies through policy reform and other initiatives. However, the overall reduction in GHG emissions is falling short of meeting the Paris target of reigning in average global warming to less than 2°C from pre-industrial levels by 2100. Instead, our baseline scenario is compatible with global warming with a mid-point of approximately 2.2°C. This scenario for global emissions falls somewhere between the IEA's Announced Pledges Scenario and the Stated Policies scenario. The scenario also embeds damage caused by chronic physical shocks. The assumptions used in preparing our IFRS financial statements are aligned with this scenario.

Critical assumptions

To assess the financial impact of CER risks, we assumed that physical risk, such as floods or drought, may lead to loss of productivity for businesses and property damage for home owners. In the short term, transition risk is expected to lead to higher costs for companies transitioning to a carbon-free environment. The transition may also result in some

companies' business models becoming obsolete or in a significant drop in demand. For home owners, transition risk may lead to a fall in the prices of properties with weaker energy labels.

Metrics and estimation uncertainty

In this report we use metrics, especially in the case of our client portfolios, that are based on certain estimates, averages or assumptions. The underlying data either comes directly from clients or is sourced from external data vendors. We use sector averages if we cannot reasonably collect information, especially from our value chain business relationships. For certain metrics, such as our financed emissions, we combine several data sources.

Generally, the level of accuracy of these metrics is lower than that of financial metrics, given the quality of the inputs. The quality typically depends on whether the data is directly reported by our clients or based on proxies, the characteristics of that reported data and whether it has been reviewed by an external party, whether the data is forward-looking or historical and whether established measurement frameworks are available. All quantitative metrics relating to information on our value chain currently have a high measurement uncertainty as sustainability reporting is a developing field for most actors in our value chain and we depend on these actors for accurate information.

The data we use is subject to continuous improvement, given also that sustainability-related regulation may result in more standardised data becoming available in the future. Comparability of sustainability information between entities and over time may be affected by the lack of historical sustainability information and by the absence of uniform practices for evaluating and measuring this information. This allows for the application of different, but acceptable, measurement techniques, especially in the initial years. We aim to be transparent in our disclosures on any changes in underlying data or assumptions in order to explain movements and provide the appropriate context to readers of the report.

Background and definitions of sustainability risk

Sustainability risk is defined in our risk taxonomy and sustainability risk policy as the risk that Environmental, Social or Governance-related (ESG) factors have a negative financial and/or non-financial impact on ABN AMRO or the wider society, either directly or via other risk types. As sustainability risk is considered a material risk in our risk taxonomy, managing sustainability risk is a fundamental part of safeguarding our risk profile and supporting ABN AMRO's strategic objectives.

ESG factors can create increased risks for the bank. These, in turn, can adversely affect the bank's financial and/or non-financial performance and are a causal factor, or risk driver, of traditional risk types.

Transmission channels are the causal pathways that explain how sustainability factors lead to increased financial and non-financial risks for the bank. Understanding transmission channels is therefore key to setting adequate measures to manage sustainability risk. Transmission channels can be classified as microeconomic or macroeconomic:

- Microeconomic transmission channels are causal chains by which sustainability risk affects the bank's individual clients, resulting in financial risks for ABN AMRO.
- Macroeconomic transmission channels are causal chains by which sustainability risk affects macroeconomic factors (e.g. labour productivity or economic growth), which in turn adversely affect ABN AMRO.

Overview of how Sustainability risks can impact the bank

As part of overseeing ESG risks arising through its clients, ABN AMRO carries out a two-pronged assessment, whereby the bank manages the effects that our activities have on the world and society (inside-out) and also on how sustainability matters may affect us through the physical and transition risks we are exposed to (outside-in). More specifically:

- ‘Inside-out risks’ are the financial and non-financial risks arising when clients of the bank may have an effect on people or the planet through ESG factors (which is also defined as impact within ABN AMRO). This impact can be direct; for example, if a client causes and has to clean up water pollution.
- ‘Outside-in risks’ are the financial and non-financial risks arising when climate or environmental factors may have an effect on the bank and its clients (either at an individual client or portfolio level). For example, extreme weather events such as flooding can have an effect on the value of a client’s collateral in the bank’s mortgage portfolio. Outside-in risks are, in turn, split into transition risks and physical risks:
 - Transition risk refers to financial and non-financial risks that result, directly or indirectly, from the process of adjusting to a lower-carbon and more environmentally sustainable economy (e.g. changes in regulation, consumer preferences or technology).
 - Physical risk refers to the financial risk of climate change and environmental degradation. Physical risk can be acute (for example, when it relates to extreme weather events) or chronic (when it relates to progressive shifts such as rising temperatures and biodiversity loss).

Strategy and business model

Sustainability in relation to our strategy and business model

The main impact in our value chain is the downstream impact associated with the clients we finance, primarily through our lending portfolios — such as mortgages and corporate loans — which are central to these Sustainability Statements. The relevance of consumer loans depends on their use of proceeds, when known, in line with the principles of the EU Taxonomy Regulation. Examples are real estate, building renovation loans and motor vehicle loans. While our non-lending activities may have a significant environmental impact, best practices for accounting for them are still evolving. For instance, methodologies for calculating financed GHG emissions for government bonds and underwriting now exist, but broader guidelines for government exposures and underwriting remain unclear. Similarly, undrawn facilities and guarantees, although not on our balance sheet, facilitate economic activity, yet there is no established approach for assessing their impact.

The influence ABN AMRO has on client assets (investments managed or facilitated for clients) varies depending on the service provided: Discretionary Portfolio Management, Advisory or Execution-only. Nevertheless, ABN AMRO regards client assets as relevant from a sustainability perspective, as evidenced by our previous reporting. In line with past years, we have again chosen to disclose information about our client assets portfolio with regard to climate change mitigation and workers in the value chain.

Besides the impacts identified through our downstream activities and based mainly on our lending portfolios, positive and negative impacts also occur through the products and services that we offer and through the strategic choices that are made regarding, for example, privacy, financial inclusion and access to services. This is described in more detail in the Social section of the Integrated Annual Report 2024.

Linking our business model to sustainability matters

Sustainability as part of our strategy

Sustainability is a key component of ABN AMRO's strategy, representing one of three strategic pillars. Sustainability has been part of our strategy since 2018, and has been operationalised through our sustainability ambitions and targets since 2020, ahead of CSRD.

In line with the role of sustainability as a pillar, we have steered on and set accountability via our Sustainability Acceleration Standard (SAS). The SAS itself is a comprehensive methodology for measuring our Sustainability (acceleration) assets so as to assess our performance bank-wide and on a client-unit level.

SAS, as an overarching metric, includes topics defined as material in our DMA assessment (such as climate change and circular economy), but was not developed for the purpose of measuring the progress of the identified material matters and should not be considered a metric under ESRS. The value of SAS as a KPI is that it aims to enable and stimulate clients (and bankers) in their transition to become more sustainable.

ABN AMRO does not solely steer its sustainability efforts on SAS. We have also set climate targets to reduce our impact on climate, and are working to identify impact-related metrics for other material matters.

SAS, including EU taxonomy-aligned assets measured by the Green Asset Ratio (GAR), is a volume-based metric, while the climate strategy metrics have a direct impact (on GHG emission reductions). In several cases, a positive development in SAS volume will have a positive impact on our pathway towards climate targets, if these loans are provided to clients in sectors in scope and the loan is aimed at mitigating climate impact. However, not all cases have a direct link between SAS (or GAR) and climate reduction pathways as, in some cases, loans will only have an impact on client emissions at a later moment in time.

Our first priority in this context is ensuring that KPIs and metrics are clearly linked to the impacts they aim to measure. In the future, we aim to further enhance the connectivity between different sustainability metrics and targets, recognising that different metrics may still be needed for different purposes.

Current and anticipated effects of material matters on strategy and business model

ABN AMRO's strategy incorporates the material matters identified in the DMA through three focus areas: climate, nature and social impact. Since no new material matters were identified, and no previously identified matters lost their relevance, the 2024 outcomes confirmed the relevance of our current focus areas, requiring no immediate adjustments to our approach. In the following sections we explain how each material topic impacts ABN AMRO and outline the bank's actions in response. The financial plan also details existing initiatives, alongside associated risks and opportunities.

As part of the DMA, the bank determined that climate-related and environmental risks are highly likely to materialise over the medium to long term. A bank-wide ICAAP stress test evaluated the financial impact of ER and other risks over

a five-year horizon, concluding that the effects are well within our loss-absorbing capacity. This confirms the business model is sufficiently resilient to cover the risks in our adverse scenario. As a result, we consider the design of our business model resilient to these risks. For more details, refer to the Business risk section in the Risk, capital and funding chapter of the Integrated Annual Report 2024.

ABN AMRO's approach to addressing climate and environmental risks centres on stimulating and supporting clients' transition efforts. For example, we offer financial incentives within residential mortgage terms to encourage sustainable home improvements. At the same time, we need to balance material matters such as the environmental and social aspects of sustainability. For example, we acknowledge our social duty as an enabler of home ownership. Consequently, we do not discriminate in lending based on physical risk indicators. Our assessment and approach remain consistent with the previous year.

Current and anticipated effects of impacts

Climate and environmental effects

ABN AMRO primarily impacts the environment through its clients. These impacts include climate change, air and water pollution, biodiversity loss and challenges related to the circular economy, each of which can have cascading effects. Most environmental effects arise from the financing, investment products and other services we provide, while our own operations have a very small environmental footprint. As we finance a diverse range of economic activities, describing the effect, or potential effect, of material matters on people and the environment in a comprehensive way is challenging. For example, climate change may lead to short-term economic costs through more frequent and severe extreme weather events. These economic costs can further increase in the long term due to persistent climate change impacts, including further temperature rise, glacial and ice sheet melting and ocean acidification. Air pollution can harm ecosystems, contribute to respiratory and chronic diseases and reduce agricultural yields.

ABN AMRO strives to be its clients' first-choice partner in sustainability by offering financing and expertise to support their transition to more sustainable business models. We also align our operations and client engagement with climate and environmental objectives.

Social effects

The bank's approach to social impact aims to foster equality and protect human rights. We address social impacts both within our operations and through our clients' activities. ABN AMRO recognises the positive and negative effects of social impacts; for example, equal treatment and opportunities for all can have positive effects such as improved team dynamics, but also negative effects such as mental health strains if treatment is perceived as unequal.

ABN AMRO has launched various initiatives to enhance workplace inclusivity and contribute to broader societal goals. We integrate social considerations into our operations to create a more inclusive and resilient bank. These efforts include initiatives targeting diverse groups, such as women, individuals from minority cultural or ethnic backgrounds, people with disabilities, asylum seekers with refugee status, different generations and the LGBTIQ+ community. Activities focusing, for example, on neurodiversity and our Reboot and B-able programmes reflect our objectives in these respects. More details can be found in the Social section of the Sustainability statements chapter in Integrated Annual Report 2024.

Current and anticipated effects of risks and opportunities

The DMA also highlighted significant climate-related opportunities. The energy transition requires substantial early-stage capital, with ABN AMRO planning to allocate up to EUR 1 billion by 2030 through direct equity, fund investments and hybrid debt. In addition, ABN AMRO aims to increase its lending exposure to renewable energy and decarbonisation technologies to EUR 10 billion by 2030.

Risk management of sustainability matters

Sustainability risk management framework relating to ABN AMROs clients

Sustainability risks, including the risk of negative impacts, that relate to our clients are managed in line with the bank's enterprise risk management cycle (ERM cycle), also referred to as the Sustainability Risk Management Framework. The risk governance in place, together with the Sustainability Risk Policy Framework, ensures oversight and operationalises how we manage risks, including negative impacts, relating to sustainability matters in our downstream value chain.

The Sustainability Risk Management Framework applies to new and existing clients throughout their lifecycle (i.e. from client acceptance, through ongoing due diligence and to a potential client exit).

Sustainability Risk Management Framework

Examples of tools and processes:

- 1 Sustainability risk management and strategy, target-setting and climate strategy
- 2 Climate, environmental and social risk heatmaps, CER materiality assessment
- 3 Portfolio scenario analysis, CASY (Client Assessment on Sustainability), stress testing
- 4 Lending criteria, risk policies, engagement
- 5 Risk appetite on sustainability risks
- 6 Sustainability risk reporting at business, risk and executive committees
- 7 Insights sustainability risks to decision-making

Sustainability risk governance relating to ABN AMRO's clients

Risk management sub-committees (positioned directly below the Board-level executive committees) support effective and efficient risk management throughout the bank, each with their own remit:

- Business Risk Committees (BRCs) for oversight on sustainability risk within the specific client units and approval of client unit-specific sustainability risk issues (e.g. scenario analysis). The BRCs meet monthly or quarterly.
- Scenario and Stress-test Committee (SSC) for oversight on climate-related and environmental risks, scenario analyses and stress testing. The SSC meets quarterly.
- Financial Crime Risk Committee (FCRC) approves bank-wide and client unit-overarching decisions on financial crime risks related to money laundering, financing of terrorism, sanctions, bribery, corruption, tax integrity and fraud within the client lifecycle. As part of its remit, the FCRC may deal with sustainability-related aspects in relation, for example, to proceeds of environmental crime. The FCRC meets monthly.
- Methodology Acceptance Group (MAG) approves decisions on the validation and subsequent use of risk models and other models, for example climate stress testing methodologies and models. The MAG meets monthly.
- Impairment & Provisioning Committee (IPC), which designs, implements and manages enterprise-wide impairments, provisions and value adjustment programmes. As part of its remit, the IPC may deal with sustainability-related aspects in relation, for example, to credit losses that may arise in the context of climate transition risk. The IPC meets monthly.

Alongside these risk committees, day-to-day activities and oversight are performed by the Sustainability Risk team within Central Risk Management.

The above risk sub-committees are supported by other first-line-of-defence committees such as the Engagement Committee, which is one of the executive business-led committees. The Engagement Committee is mandated by the Executive Board and is responsible for overseeing the bank's engagement activities regarding clients, sectors and

material suppliers so as to ensure that material ESG risk engagement is appropriately documented and that adequate measures are taken to stay within the bank’s chosen ESG risk. The aim of such engagement approach is to operate in compliance with the bank’s policies for the management of ESG risks, as well as with the UN Guiding Principles on Business and Human Rights (UNGPs) and the OECD Guidelines for Multinational Enterprises.

Sustainability risk policy framework

Our Sustainability Risk Policy Framework underpins how the bank manages sustainability risk, including negative impacts, in relation to our clients. The Sustainability Risk Policy Framework includes our sustainability risk policy, as well as standards and exclusions. It is subject to an annual review to incorporate new insights and practices, internal and external developments, and views of stakeholders, as well as to align with the latest regulatory guidance, such as ECB and EBA requirements and definitions.

The exclusions applied by ABN AMRO relate to specific activities outlined in the Governance of sustainability matters section of the Integrated Annual Report 2024. In practice, these exclusions mean that we will not knowingly provide financial products or services on our Exclusion List, or engage in business with a client listed in our Controversial Weapons List.

The sustainability risk policy articulates how the bank puts its Sustainability Risk Framework into practice by outlining the main principles and requirements for managing the sustainability risks adversely impacting ABN AMRO in relation to our clients (new and existing) for the duration of their lifecycle (i.e. from client acceptance, through ongoing due diligence and to a potential client exit). The sustainability risk policy also covers proprietary investments. The policy defines minimum requirements and sets rules for managing sustainability risks relating to the bank’s clients in line with the bank’s risk appetite and enterprise risk management framework, including:

- the definition of sustainability risks
- the governance of sustainability risk management
- how we engage with clients that do not comply with our standards
- minimum requirements for managing sustainability risks relating to client onboarding and during the client lifecycle, lending activities and proprietary investments. As part of the delegated authority granted to it by the Executive Board, the Group Risk Committee is responsible for approving the sustainability risk policy. In line with our framework, this policy is reviewed and approved at least annually, taking into account feedback from relevant internal stakeholders (such as Credit risk and our client units) and external stakeholders (such as NGOs). It is then communicated internally across the first and second lines of defence, and an abbreviated version is available to external stakeholders on our website.

Sustainability-related standards and generic principles applicable to corporate clients

Generic principles

Minimum sustainability requirements underpinning the SRPF (Sustainability Risk Policy Framework) for corporate clients operating in higher-risk sectors

Clients comply with applicable laws and regulations and are able to demonstrate transparency regarding their responsible business conduct.

Clients know the salient human rights risks of their own activities and business relationships and take measures to address these risks.

Clients have a satisfactory ESG track record.

Clients have identified potentially affected groups and other relevant stakeholders and engage with them constructively and openly in assessing and mitigating human rights risks and addressing any grievances.

Clients take measures to promote circularity and reduce the use of virgin material and waste (e.g. through design, recycling, life-time extension), if applicable.

Clients monitor their GHG emissions and take measures to reduce them in line with the Paris climate goals.

Clients are aware of how their business model depends on ecosystem services (i.e. resources, pollination) and take measures to preserve these services.

Clients are aware of what the transition to a Net Zero economy means for their business model and take appropriate measures to prepare for the transition.

Clients are aware of their impact on biodiversity, water, air and soil and take appropriate measures to prevent biodiversity loss and pollution.

Clients are aware of the physical risks of a changing climate for their business model and take appropriate measures to mitigate these risks.

Our Standards and Generic Principles define the sustainability requirements against which our corporate clients must be assessed to ensure appropriate risk response measures.

The Generic Principles form the foundation of our Environmental, Social, and Governance (ESG) assessment of the bank's corporate clients to whom we provide corporate loans or other financing. These Generic Principles are operationalised into specific requirements for our Corporate Banking, Wealth Management, Personal & Business Banking clients.

These Generic Principles support the assessment of whether our clients comply with the United Nations (UN) Guiding Principles on Business and Human Rights (UNGPs) and the Organisation for Economic Co-operation and Development (OECD) Guidelines for Multinational Enterprises (MNEs), where applicable and as required under Article 18 of the EU Taxonomy Regulation. Although our Generic Principles have remained the same, we have enhanced our underlying Standard with Client Requirements, so that it now applies consistently across all our clients, as well as aligning with the terminology used in the Corporate Sustainability Reporting Directive (CSRD) and related European Sustainability Reporting Standards (ESRS). This Standard also considers the maturity of a client on its ESG journey by taking into account the size and/or sector in which the client is active. The Standard with Client Requirements has additionally been updated on two points relating to the energy sector:

- Firstly, we have widened the lending exclusion to direct lending to oil and gas fields licensed for development to after 2023. This change aligns with the International Energy Agency's (IEA) latest Net Zero Emissions (NZE) 2050 scenario.
- Secondly, we have removed the exclusion of stand-alone project finance for nuclear power generation. This change is based on the recognition that nuclear power is an integral part of the global energy mix, as noted in the IEA NZE scenario, and is included in several countries' transition strategies. However, given the inherent risks associated with nuclear power generation, we have reinforced our due diligence procedures and established stringent criteria for financing nuclear power projects.

Business strategy and strategic decision-making (steps 1 and 7)

The Sustainability Risk Management Framework, which operationalises how we manage sustainability matters via the ERM cycle, starts with the setting of the business strategy by the first line of defence. The subsequent risk management monitoring and oversight are carried out by the second line of defence.

The business strategy on sustainability matters cannot be set in isolation and, as such, has to align with the bank's risk appetite and risk policies in the second line of defence. As a result, the business strategy and subsequent strategic decision-making go hand-in-hand with the risk control and oversight carried out in the ERM cycle (described in the next sections):

- Insights into sustainability risks inform strategic decision-making. For example, the bank's climate strategy was developed partly in response to climate-related transition risks. Similarly, decisions to engage with a specific client or group of clients to accelerate the sustainability shift are informed by client- or sector-level risk identification and measurement, while decisions to reduce, maintain or expand certain portfolios are informed by our insights into sustainability risks.
- Sustainability risk management is also informed by ABN AMRO's strategic commitments to sustainability matters. For example, our risk appetite limits take into account several elements, such as our strategic targets on carbon reduction. In other words, key performance indicators and key risk indicators should be looked at alongside each other. Similarly, the sustainability risk policy framework is updated regularly to assess, for example, clients' alignment with our strategic objectives.

Risk identification and materiality assessment (step 2)

The risk identification part of the ERM cycle relies to a large extent on our Environmental and Social Risk heatmaps. These heatmaps inform, for example, the CER materiality assessment, the CER stress testing and the risk appetite. Alongside our risk heatmaps, we scan our emerging risks on a quarterly basis. Risks identified as most material following the emerging risk scan and assessment with our internal expert stakeholder group feed into our Risk Event Register (RER), which subsequently informs our risk taxonomy and scenario booklet.

The Environmental and Social Risk heatmaps identify sub-sectors' inherent sensitivity to sustainability events. These are sub-sectors in which we operate through our corporate lending and residential real estate portfolios (i.e. business environment). The business environment is analysed under both a sectoral lens (64 distinct sub-sectors) and a geographical lens (regions and countries to which we have exposure, either directly or through sub-sectors' value chains).

The sensitivities in the Overview of environmental and social risk heatmaps for corporate loans are based on the sector sensitivities to more than 40 potential underlying physical, transition and negative impact events and focus on our corporate lending activities in the downstream part of the value chain. Examples of these events include flooding and water stress for physical events, policy and market effects for transition events, and greenhouse gas emissions and water use intensity for negative impact.

The heatmap below shows an aggregated¹ score of negative impact, transition risk and physical risk scores in order to provide an overview of sensitivities across sectors broken down by topic.

¹ The aggregated score takes into account the following factors for each topic: negative impact, transition risk and physical risk. We then use the most sensitive factor (i.e. most conservative approach) for our heatmaps.

Overview of environmental and social risk heatmaps for corporate loans^{1,2}

Risk assessment and measurement (step 3)

Various tools are used to assess and measure sustainability risk at different levels:

- At a bank level: sustainability risk elements concerning climate change are part of the internal stress testing scenarios and climate and environmental risks.
- At a portfolio level: scenario analysis is used to measure the impact of sustainability risk in specific portfolios. In 2024, climate scenario analyses were performed for the residential and commercial real estate portfolios. In addition, the product approval and review process considers sustainability risks, alongside other risks, that may arise in our product offering, such as residential mortgages.
- At a client level: sustainability risk of corporate clients is assessed using (i) the Client Assessment on Sustainability (CASY) questionnaire (if they have a lending relationship above EUR 1 million), which addresses clients' compliance with the bank's Sustainability Risk Framework; (ii) the Transition Readiness Assessment (TRA), which focuses on sectors and clients in scope of our climate strategy and measures clients' maturity in terms of transition readiness; and (iii) the Climate and Environmental Risk Classification Tool (RCT), which focuses on corporate clients with non-programme lending and classifies clients based on their vulnerability to climate and environmental risks. The CASY and RCT output are included in the credit risk assessment, second-line validation and credit risk decision.

In addition, we made further enhancements during 2024 to our CASY tool, which applies to corporate clients seeking loan financing. This tool is used in the first line of defence to assess these corporate clients' ESG performance against our Generic Principles, which have been translated into requirements for corporate clients in sectors with a higher risk sensitivity. The substantial enhancements made to our CASY tool in 2024 have allowed us to improve our sector-specific view on potential ESG risks and also to have a better-informed assessment of clients' performance against risks seen in every sector.

Based on the improved methodology, sectors have been assigned a risk level across six different ESG themes (such as environmental and social impact) ranging from low to high risk. Social risk for some sectors can be low, while climate or environmental risks may be high. Based on the risk level across the six ESG themes, our corporate clients are

¹ These values take into account the negative impact of each individual ESG topic relative to the other ESG matters shown in the table, enabling cross-topic comparison. For topics E1 to E4, this takes into account sensitivity to transition and physical risks. For E5, S2 and S3, this takes into account sensitivity of negative impact related to transition risks.

² E3 and S3 are included in this overview as they were part of our identification process, but in the subsequent double materiality assessment these topics were assessed not to be material for ABN AMRO.

expected to have risk mitigants, policies and measures in place appropriate to the assigned risk level. This means we expect better performance from clients where a certain ESG risk is deemed high. If we believe a corporate client is not performing in line with what we regard as appropriate for the identified risk levels, we will consider engaging with the client in order to seek to improve its performance.

In anticipation of a new version of CASY in 2025, we already started assessing clients on the basis of the Generic Principles in 2024. Clients active in sectors with higher ESG sensitivity were assessed on typical ESG risks, such as climate impact, biodiversity, human rights and workers in their value chains. In 2025 we plan to continue rolling out this tooling for sectors with lower ESG risk profiles.

Risk response (step 4)

To ensure that sustainability risk is managed in line with the bank's risk appetite and strategy, mitigating actions are defined at bank, portfolio and client levels.

At a bank level, mitigating actions for sustainability risks are as follows:

- exclusion of some specific sectors and sub-sectors from lending products and our banking services, as stated in the bank's Exclusion List (for example, illegal logging)
- Controversial Weapons List, where we identify companies with which we do not want any relationship at all because of their involvement in the production of controversial weapons
- strict requirements for corporate lending under the Sustainability Risk Standard with Sector Requirements
- sustainability risk considerations included in the bank's credit risk and business risk policies
- our climate strategy for high-emission sectors, portfolio management and wider sector strategies

At a client and portfolio level, we will consider engaging with companies we finance and that do not comply with our standards, with the aim of improving their performance. Our overall system for and approach to this type of engagement remained unchanged during the reporting period. We divide our engagements with corporate clients into three general categories: normal intensity, high intensity and thematic.

- Normal intensity: an ongoing process is tailored to the client's particular risk or impacts and improvement areas. It is used as a mitigating action at a client level and focuses primarily on remediating breaches of the sustainability risk policy framework.
- High intensity: a formal, time-bound process is established involving setting detailed objectives. This process is closely monitored by relationship managers and the Credit Risk Sustainability team, with quarterly oversights by our Engagement Committee.
- Thematic: this category applies if we identify that a sector or industry is at risk of breaching the bank's ESG-related requirements, including our requirements regarding human rights. Various teams within ABN AMRO can propose thematic engagement, and the decision to engage is taken by our Engagement Committee. We use thematic engagements for risk mitigation purposes, as well as to achieve our strategic objectives for accelerating the sustainability shift. In 2024, for example, we performed a thematic engagement on the shipping sector.

Risk control & monitoring and risk reporting (steps 5 and 6)

Monitoring activities aim to act as a safety net to capture and identify potential shortcomings in our Sustainability Risk Policy Framework in a timely manner. Our monitoring activities are carried out in a variety of ways and at various levels:

- As part of our top-down monitoring, we measure the bank's risk profile and compare it to the bank's Strategic Risk Appetite Statement (SRAS). The SRAS is split into three key areas: sustainable business model & value creation, financial soundness and sound operating environment. A key element in the sustainable business model & value creation is the management of our portfolio towards a net zero 2050 trajectory in line with the sustainable finance criteria contained in our policies and climate strategy. The resulting SRAS informs our Bank Risk Appetite Statement (BRAS), which aims to set the boundaries for the bank's overall risk profile, including on sustainability risk.
- Positioned below the BRAS, the sustainability risk appetite is set using indicators that address key ESG factors, as well as the inside-out and outside-in perspectives of sustainability risk. To ensure that a sustainability risk identified remains within the approved risk appetite, we set limits and checkpoints and monitor these at bank-wide, client unit and functions levels. This allows us to take timely mitigating actions. These indicators are reviewed on an ongoing basis as we gain access to more granular insights and data over time.

- At a more granular level, the development, review and implementation of risk appetite limits and checkpoints at bank-wide, client unit and functions levels are additional important elements in our risk monitoring.
- Additional bank-wide KRIs are established directly at the level of the client units and functions, where they have their own specific KRIs. These KRIs are increasingly informed by insights from sustainability risk identification and measurement efforts such as scenario analyses.
- In 2024, we also further enhanced our monitoring activities by introducing additional internal monitoring and testing controls to support our Sustainability Risk Policy Framework's adherence to a particular focus on our client onboarding and review and lending process requirements.

Sustainability risk appetite indicators

	Indicator	Checkpoint/limits	Monitoring only
Sustainability risk	Percentage of clients requiring a valid ESG risk assessment	●	
	Sustainable and Acceleration Standard volume change	●	
	Green Asset Ratio (EU Taxonomy-aligned volume)		●
Climate risk	Change in carbon footprint in lending and investment portfolio	●	
	Coverage of bank's commitments to Net Zero Banking Alliance decarbonisation targets	●	
	Climate strategy sector performance		●
Environmental risk	Relative exposure in sectors sensitive to physical environmental risks		●
	Relative exposure in sectors sensitive to transition environmental risks		●
Human rights risk	Strength of human rights risk management	●	
	Exposure to sectors sensitive to social risk		●

The status of adherence to the risk appetite and the outlook are discussed monthly by the Executive Board and quarterly by the Supervisory Board, based on the Enterprise Risk Management report, as stated under EU OVA.

CER materiality assessment

A materiality assessment on Climate & Environmental Risks (CER) is carried out annually for traditional banking risk types. This assessment constitutes part of our annual risk identification process in our enterprise risk management cycle, and the outcome feeds into the bank's risk taxonomy and into the assessment of sustainability risk as part of the bank's double materiality assessment. The CER materiality assessment methodology and scenarios are explained in the Our materiality assessment section earlier under this disclosure.

The scope of the assessment was the entire balance sheet of the bank. The credit risk type assessment examined the risks in the loan book, while the market and liquidity risk type assessment stressed the fair valuation assets for CER. The risks related to property and equipment were captured by the non-financial risk type assessment. The table below provides an overview of the 2024 CER assessment results for the short term (ST), medium term (MT) and long term (LT). Further details on risk type assessments are provided below.

Materiality Assessment Table

Risk types	Climate risk						Environmental risk					
	Physical risk			Transition risk			Physical risk			Transition risk		
	ST	MT	LT	ST	MT	LT	ST	MT	LT	ST	MT	LT
Credit risk	○	○	●	○	○	●	●	●	●	●	●	●
Market risk in the trading book	○	○	○	○	○	○	○	○	○	○	○	○
Market risk in the banking book	○	○	○	○	○	○	○	○	○	○	○	○
Liquidity risk	○	○	○	○	○	○	○	○	○	○	○	○

Non-financial risk	●	●	●	●	●	●	○	○	○	●	●	●

○ Climate and environmental risk is assessed as not material

● Climate and environmental risk is material

CER materiality assessment - Credit risk

In scope of the CER materiality assessment in Credit risk are the mortgages, commercial real estate (CRE) and corporate portfolios as these are the main portfolios for which clear transmission channels are determined. Our assessment covers approximately 90% of the lending portfolio. Portfolios not included in the CER materiality assessment scope are predominantly related to Clearing clients and consumer loans.

We applied a product approach for loans that are collateralised by real estate (residential mortgages, CRE) and corporate loans as a general product category, given that clear transmission channels could be defined for these product types. The methodology for physical risk applies an expected loss approach, where the probability of a specific CER event occurring is multiplied by the estimated loss when it occurs and the effect of this on the loan-to-value of the collateral. For transition risk, a similar expected loss approach is used, where several scenarios (Network for Greening the Financial System, carbon pricing) are assessed.

The quantitative materiality assessment of CER impact on credit risk performed by ABN AMRO in 2024 showed that the impact of environmental risk on credit risk is material in the short, medium and long term. Climate risk is also material for credit risk, but on a longer term.

Identification and measurement

We used various analyses to assess the materiality of climate risk, including our climate risk heatmap, climate scenario analyses on the mortgage and commercial real estate portfolios, a climate stress test on part of the corporate portfolio and an environmental risk scenario analysis. The materiality assessment of environmental risk is mainly based on a qualitative assessment, supported by scenario analyses.

Mitigating measures

Various measures have been taken in order to mitigate CER within Credit Risk. These relate to credit risk acceptance, risk monitoring, risk appetite setting and financial buffers.

Risk appetite

Credit risk indicators related to climate physical and transition risk were included in the Risk Appetite Statement in 2024. As well as monitoring several CER-related indicators, we set, as part of our risk appetite, limits and checkpoints for vulnerable collateral in increased physical risk areas in the mortgage portfolio and also monitor carbon-related exposures relative to the corporate lending portfolio. This is a developing area.

Capitalisation and provisioning

ABN AMRO recognises loss allowances based on the Expected Credit Loss model (ECL) of IFRS 9. For expected credit loss calculations, ABN AMRO uses macroeconomic scenarios which implicitly incorporate climate and environmental risks. Integration of CER in the credit risk model landscape is currently under construction. In the meantime, based on our materiality assessment results, we have taken management overlays for climate and environmental transition risks and an economic capital add-on for climate transition risk. Given the combination of macroeconomic scenarios and these management overlays, we consider the bank adequately provisioned for climate and environmental risks.

Climate and Environmental Risk in the Credit Risk Model Landscape

Incorporating CER into the credit risk model landscape is challenging for multiple reasons. These vary from a lack of granular and high-quality data to changes in regulatory requirements and limited past materialisation of CER on credit risk. This makes future estimates uncertain, especially over different time horizons. Despite these challenges, we have devised a roadmap on how to integrate CER risks into the credit risk management framework: this covers the process from loan origination, where future high-quality granular data will be created, to modelling and stress testing to service our PD and LGD risk models, and reporting on capital adequacy (economic capital and Basel IRB) and IFRS 9.

CER materiality assessment - Market risk in the trading book

Climate and environmental risk events can materialise in market risks within the trading book. More specifically, CER events can have a negative or potentially negative effect on the bank's P&L through the revaluation of fair valued positions (in particular the bond portfolio) held with a trading intent. In order to assess the impact, stress scenarios have been applied by shocking the market risk factors (e.g. credit spreads). The impact was found to be immaterial because the bond portfolio in the trading book is concentrated in sovereigns and highly-rated financial issuers, which have low sensitivities to physical or transition risks. Accordingly, CER in market risk in the trading book is assessed to be immaterial.

CER materiality assessment - Market risk in the banking book

Climate and environmental risk (CER) events can materialise in market risks within the banking book. More specifically, CER events can have a negative or potentially negative effect on the net interest income (NII) of the bank through changing client behaviour and changes in regulation that have an effect on the bank's interest rate risk position, changing interest rate curves and increases in funding spreads. Based on scenario analyses, the effect of a single physical or environmental event via the NII on the financial indicators of the bank has been assessed to be low, due to the relatively low interest rate sensitivity of portfolios with a higher sensitivity to physical or transition risks. Accordingly, CER in market risk in the banking book is assessed to be immaterial.

CER materiality assessment - Liquidity risk

In 2024, we updated our assessment of the materiality of climate-related and environmental risk also in relation to liquidity risk. The assessment was quantitative, with a focus on the short term (within 1 year) and medium term (within 5 years). The funding plan of the bank is updated on at least a quarterly basis in order to anticipate medium and long term risks so the bank can adjust its business plan accordingly. Therefore, longer term events have less impact on liquidity risk as the bank has sufficient time to steer the business. The potential negative P&L impact of such business steering is captured under business risk.

To ensure consistency across risk types, we looked at a set of predefined CER events, including climate-related risk events such as floods and drought (physical risk) and policy and technology development (transition risk), as well as environmental risk events. The results of the materiality assessment for liquidity risk are summarised below.

The assessment considers whether material CER could cause net cash outflows and consequent depletion of the liquidity buffer. If material, these factors should be incorporated into the liquidity risk management and liquidity buffer calibration. The impact of CER on the bank's funding market access, funding costs and the liquidity value of the liquidity buffer was also assessed, both for CER transition risks and physical risks. The analysis confirmed that the overall CER impact on liquidity is not currently considered to be material, supported by our sustainability objective and other relevant initiatives.

CER materiality assessment - Business risk

The CER business risk relates to the present and potential effect of events on the operating result of the bank. To assess the CER business risk in 2024, ABN AMRO used a combination of qualitative and expert judgements and the outcomes of existing quantitative analyses, including the 2022 ECB Climate Stress Test, ABN AMRO's environmental risk heatmap, climate scenario analyses and the impact of the climate transition risk on business risk, in line with the bank's climate strategy.

ABN AMRO assessed the impact of climate transition risk on business risk via the impact of CO₂ reduction targets on lending volumes and revenues for the horizons and sectors in scope.

We aim to reduce business risk for ABN AMRO by increasing the sectors in scope of targets set in line with external good practice and mitigating transition risk.

Climate physical risk

With regard to physical climate risk, individual CER events have not historically had a material impact on our operating expenses, and are not expected to do so in the near future. Instead, we expect that the impact of physical risk will gradually materialise over the medium and longer term, and may particularly affect our mortgage and commercial real estate portfolios. Specifically, we are seeing a gradual rise in physical damage to collateral as a result of severe flooding events and foundation issues (e.g. pole rot), which could have an effect going forward. The effect of a single physical or environmental event on the bank's operating income is currently assessed as marginal.

Climate transition risk

Transition risk refers to the direct and indirect financial and non-financial risks arising from the transition to a lower-carbon economy. This could impact the bank through changes in its (or its clients') regulatory environment, business model or consumer preferences, while the consumer preferences could in turn have an impact on ABN AMRO's business model. In the short-term, we assess transition risk as not material. In the medium to long term, material business risks could result from adjustments made to ABN AMRO's commercial or risk policies in order to reduce other CER-related risks or to decrease emissions within client portfolios in accordance with climate-related regulations.

Environmental risk

Environmental risks are risks occurring due to the degradation of the environment (physical risk) or the transition to a more environmentally sustainable economy affecting ABN AMRO's clients and, by extension, its business model through mechanisms similar to those for climate physical risks and transition risks. Environmental risk events with a high probability and potentially material impact relate to transition risk factors such as regulations or technology.

We manage material CER in business risk through the medium or longer-term portfolio choices we make regarding company strategy. Our assessments in the areas of long-term value creation and potential impact help to reinforce these decisions.

Resilience of our business model to CER risks

Climate-related risks are also considered in the bank's stress testing process, which tests the bank's resilience under an adverse scenario over a medium-term (5 year) horizon. Environmental risks will be integrated into the stress testing framework in the future.

Adverse stress test methodology and scope

As described in the EU OVA - stress testing and scenario analysis section, the adverse stress test assesses the effect of the adverse macro-economic scenario on the bank's profitability and capital position based on quantitative models as well as expert opinions.

The stress test scope is bank wide. Balance sheet assumptions are aligned with bank's five-year forward looking financial plan, in which financial effects from CER are considered. Our adverse stress test considered the climate-related risk drivers as follows:

Adverse case scenario

Our adverse macroeconomic scenario assumed an abrupt tightening of climate policies, for instance due to a large physical risk event (not specific to the Netherlands) or lagging targets. As a result, the price of emitting carbon would increase rapidly, leading to increased transition risks. Consumer and investor confidence would be hit. Non-renewable energy prices would increase sharply, also due to higher (shadow) carbon prices and there would be a significant inflation impact. There would be a squeeze on household disposable income and corporate profits due to the higher cost pressures, while higher policy rates and credit spreads would also weigh on demand. Real estate prices would fall as the macroeconomic backdrop deteriorates. On top of that, the Dutch government would impose more stringent rules on less energy efficient real estate, which would drive prices of these buildings even lower. A significant hit to real GDP growth would follow.

Adverse stress test results

As part of the DMA, the bank determined that climate-related and environmental risks are highly likely to materialise over the medium to long term. A bank-wide ICAAP stress test evaluated the financial impact of CER and other risks over a five-year horizon, concluding that the effects are well within our loss-absorbing capacity. This confirms the business model is sufficiently resilient to cover the risks in our adverse scenario.

CER in our strategy and business model

Next to the adverse stress test, the bank has undertaken several business steering activities to ensure continued business model resilience, such as commitment to the Paris Climate Agreement, Net-Zero Banking Alliance, our climate strategy, as well as other initiatives to enhance positive social impact. With regard to the physical risks, which sit predominantly in our residential mortgages business, we recognise our social duty as an enabler of home ownership, and therefore we do not discriminate lending by physical risk indicators.

ESG materiality assessment - Non-financial risk

Methodology

The NFR Stress Test Methodology is used to determine the materiality of CERs for NFRs. This methodology provides a structured approach to assessing potentially high-impact non-financial risk events facing the bank and/or its clients (specifically focused on CERs) over 1-year, 5-year and 30-year horizons. These assessments were based on the available CER information and status of ABN AMRO at the time of the assessment. An integrated NFR assessment was performed with the involvement of experts from the first and second lines of defence, who determined the need to change scenarios and/or reassess outcomes of the 2023 assessment.

Selected scenarios for the assessment

Five scenarios were short-listed as potentially material in the NFR domain. They concerned one physical threat relating to data centre failure, three greenwashing scenarios and one scenario relating to the bank's duty of care (regarding mortgages).

Outcome of the assessment

Climate physical and transition risks and environmental transition risks were considered material at all time horizons.

Transition risks (related to climate and environmental risk)

The three greenwashing events (misreporting, mis-selling and mis-advertising) were still considered material, and the outcomes of the 2023 materiality assessment regarding these events were still considered applicable in 2024. The risk response for these scenarios is 'monitoring', with no short-term need to implement additional mitigants.

Physical risks (related to climate risk)

The scenario for 'data centre failure' could produce a material impact on the bank's P&L and reputation during the 1-year horizon because of the risk of flooding. The risk response is 'monitoring' as the impact of flooding on the bank's data centres is currently being investigated.

The duty of care scenario regarding physical risk related to mortgages (decreasing value of collateral) is still material, and the outcomes of the 2023 assessment continued to apply in 2024. The risk response for this scenario is 'monitoring', with no short-term need to implement additional mitigants.

Triggers for actions during monitoring activities

Based on continuous risk dialogues and the occurrence of any major CER-related events, ABN AMRO will take appropriate action in accordance with the NFR policy.

The materiality assessment of social and governance risks (from ESG) was performed as part of the double materiality assessment.

Client assessment on sustainability

During the onboarding of corporate clients and periodically thereafter, a dialogue takes place with these clients to assess whether the client complies with the bank's minimum sustainability-related standards and the generic principles applicable to corporate clients. In addition to that, anti-money laundering and terrorist financing controls

continuously safeguard proper business conduct on the account of the bank and all its clients. Finally, sustainable home financing solutions are included in the client dialogue with both corporate and retail clients. We use the following tools to assess the sustainability risks of our corporate clients:

Transition Readiness Assessment

The Transition Readiness Assessment (TRA) tool is an engagement instrument used by the first line of defence to evaluate the willingness and ability of corporate clients active in sectors in scope of our climate strategy to adapt to a low-carbon business model (inside-out). The TRA is structured to assess clients on three dimensions:

1. Climate performance: assesses the client's CO₂ trend against benchmarks and the client's sensitivity to climate risk.
2. Transition plan: estimates the ambition of the client in terms of future targets for CO₂ reduction. It considers the characteristics of the client's transition plan (targets, governance, monitoring tools).
3. ABN AMRO's ability to support: evaluates the level of support that the bank can provide to its client for the sustainable transition.

The second line of defence will assess in the coming period whether to integrate this tool into the credit risk management process.

CASY

Client Assessment on Sustainability (CASY) is a client dialogue assessment tool that we use to assess the sustainability performance of our corporate clients with a lending relationship above EUR 1 million at client onboarding and monitoring reviews. The tool stores relevant data to help safeguard the bank against sustainability and reputational risks and provides a basis for a strategic dialogue on sustainability with clients. At client level, CASY addresses clients' compliance with the bank's sustainability risk framework by focusing on sustainability-related regulations, sustainability commitments, and the capacity to manage sustainability risks and track records. Depending on the client's level of compliance with the bank's sustainability risk framework, the outcome of a CASY assessment is above, on or below par, and serves as the basis for further engaging with the company.

CER Risk Classification Tool

The CER Risk Classification Tool (RCT) classifies non-programme lending clients in relation to their exposure to CER risks on an individual basis. The CER Risk Classification Tool allows the impact of physical climate, transition and environmental risks to be incorporated into the creditworthiness assessment at origination and at periodic reviews. Based on the outcome of the questionnaire, clients are classified into risk profiles from low to high CER risk. The RCT allows the bank to deepen its knowledge and insights on CER risks and their effects at the client level. It also ensures that the data collected can be reused for different purposes within the credit risk process.

Transmission channel framework

Transmission channels are the causal chains through which climate factors translate into financial risks to ABN AMRO by directly influencing our counterparties and the assets they hold. Physical risk, such as floods or drought, can lead to loss of productivity for companies and to property damage for consumers. In the short term, transition risk is expected to lead to higher costs for companies transitioning to a carbon-free environment. The transition may also result in some companies' business models becoming obsolete or to a significant drop in demand. For consumers, transition risk may lead to a fall in the prices of properties with low energy labels. The Transmission Channel Framework (TCF) aims to capture the possible financial impact arising from these sustainability risks that clients are exposed to, which could have an impact on the client's creditworthiness, and ultimately, the bank's profit and loss. Reflecting these risks, we improved the transmission channel assessments for the following sectors¹, which have been assessed as contributing highly to climate change:

- Agriculture, Forestry and Fishing (A01-A03)
- Extraction, Oil & Gas (B05-B09)
- Manufacturing Metals & Chemicals (C10-C33)
- New Energies (Power- D35)
- Construction (F41-F43)
- Shipping, Air & Road transport (H49-H51)

¹ Sectors refer to ABN AMRO internal definitions, and the indicated NACE codes serve as a proxy only.

- Real Estate (L68)

In this developing discipline, the ultimate goal is to have a better understanding of the possible impact of sustainability risks on the creditworthiness of the client (outside-in perspective), how to manage/mitigate them and incorporate the assessment in the credit proposal and review. We are at the early stages of this process with the help of our above mentioned tools.

Credit Risk Sustainability team

Credit Risk Sustainability, as part of the second line of defence, oversees these client-level due diligence assessments and engagement for both lending and non-lending clients. In the context of KYC processes, sustainability risk advice can be provided for lending and non-lending clients, and is triggered by adverse sustainability-related media hits, defence-related activities and/or a potential violation of the bank's Exclusion List or Controversial Weapons List.

For lending clients with a high sustainability risk level and total lending exposure in excess of EUR 1 million, an additional second-line advice is required from Credit Risk Sustainability. This provides validation on the first line assessments against the bank's sustainability risk framework.

If a client is not fully compliant with the sustainability risk framework, but demonstrates sufficient commitment and capacity to comply, the second line may accept the client relationship/line of credit, subject to conditions aimed at establishing that a client is moving towards full compliance with the sustainability risk framework. Non-compliance is then considered a driver of credit risk that could lead to the deterioration of a counterparty's creditworthiness or collateral due to physical and transition risk or prosecution for health and safety breaches. These clients are monitored annually.

If a client is not compliant with the sustainability risk framework and does not demonstrate sufficient capacity or commitment to achieve compliance, the sustainability risk advice will be negative and the credit committee may be advised to consider exiting the relationship from a sustainability perspective. Given the bank's inclusive strategy, this type of negative conclusion is a last-resort risk response.

Governance of sustainability matters

This section sets out the governance processes, controls and procedures put in place to monitor, manage and oversee sustainability matters. The focus in this section is on the Executive Board and the Supervisory Board.

Composition

To govern ESG matters effectively, the Executive Board and Supervisory Board must be equipped with the right tools to make the best possible decisions for the short, medium and long-term resilience of ABN AMRO and the wider society in which we operate.

For further information on the composition and diversity of the Executive Board and Supervisory Board, please refer to the Leadership & governance section of the Integrated Annual Report 2024.

Roles and responsibilities

The Executive Board is responsible for defining ABN AMRO's overall strategy. It oversees the implementation and execution of material sustainability matters throughout the bank. The Executive Board is also responsible for ensuring that the strategy is informed by and addresses sustainability impacts, risks and opportunities.

The Supervisory Board, in turn, supervises the policies set by the Executive Board, ABN AMRO's general affairs and the connected business. The Supervisory Board also assists the Executive Board by providing advice on sustainability matters.

To carry out its duties, the Executive Board is assisted by its committees, which offer diverse perspectives on sustainability matters, depending on their specific mandates. The Executive Board's procedural rules guide its functioning and internal organisation. Each Executive Board committee also has its own procedural rules.

The Group Sustainability Committee (GSC) is an Executive Board committee for central oversight and steering on sustainability. It serves as a central point to which material information is directed on topics that relate to sustainability. The GSC assists the Executive Board and its committees on matters that relate to sustainability oversight, including in relation to material impacts under ESRS as defined by the double materiality assessment. All relevant departments of the bank are represented within the GSC. The Executive Board has mandated this committee to assist, advise and support in the performance of its duties regarding sustainability-related matters. This includes sustainability aspects of the bank's strategy, policies and standards for various topics to drive and develop a view on sustainable long-term value creation, and formulate specific objectives in line with its mandate. Additionally, the GSC determines the actual and potential effects that ABN AMRO and its affiliated enterprises have on people and the environment. It monitors dialogues about sustainability implementation both with internal and external stakeholders. It also formulates guidance on sustainability KPIs, metrics and due diligence obligations regarding ABN AMRO's operations. The GSC advises on ABN AMRO's values, conduct, culture, and diversity and inclusion matters. It has also established a process for entering into and overseeing sustainability commitments.

The responsibilities of the Group Disclosure Committee (GDC) include advising and supporting the Executive Board in maintaining the accuracy, effectiveness and timeliness of disclosures relating to sustainability matters, including performance on social and environmental impacts, as mandated by Dutch and European law. In essence, the GDC serves as the central point for disclosing information on material matters regarding the bank and its operating environment.

The Group Risk Committee (GRC) is responsible for sustainability risk management, for carrying the mandate to review and for steering ABN AMRO's risk profile within the scope of the bank's risk appetite. This committee also evaluates the short, medium and long-term effects of environmental and social risks on ABN AMRO to support the Executive Board in making informed strategic and business decisions. This includes reviewing climate and environmental risks, as well as related sectoral financing policies, which determine both targets and limits for exposures to certain sectors. The GRC also identifies and quantifies environmental risks, with a view to managing and monitoring these risks over a sufficiently long-term horizon. In addition, it assesses interdependencies between sustainability, reputational, legal, credit and business risks, including those related to ABN AMRO's climate strategy-related initiatives.

The Central Credit Committee (CCC) takes ESG risks into account as part of its credit decisions. The CCC makes decisions on the acceptance of credit and counterparty risks relating to credit proposals. As such, it can approve or reject requests for individual corporate loans and facilities and determine whether individual transactions are in line with our policies and standards. This includes sustainability aspects falling within the scope of the risk appetite determined by the Executive Board.

Each of the Supervisory Board committees addresses sustainability aspects within its area of expertise. The Supervisory Sustainability Committee supervises sustainability aspects of our strategy and policies. These cover a broad range of topics, including those covered in the European Sustainability Reporting Standards (ESRS). The Supervisory Sustainability Committee and other Supervisory Board committees, in particular the Risk & Capital Committee and the Audit Committee, coordinate their activities and work together regularly. When required, they work on an ad hoc basis to ensure the exchange of information needed to capture and assess all relevant risks for the performance of their tasks.

The Audit Committee is responsible for supervision in relation to financial and sustainability reporting, which supervision includes monitoring the integrity and quality of ABN AMRO's sustainability statements and external disclosures.

We continuously monitor sustainability governance to ensure that sustainability matters are embedded in our governance structure. ABN AMRO aims to address sustainability matters as effectively as possible and to keep up with regulatory expectations and legislation. In doing so, we keep our finger on the pulse of evolving market practices in this area. ABN AMRO's Sustainability Centre of Excellence is led by our Chief Sustainability Officer, who reports directly to the CEO. The Sustainability Centre of Excellence supports the Chief Sustainability Officer in implementing new sustainability reporting regulations of which the Chief Sustainability Officer is the assigned owner. This includes determining metrics and validating set targets against ambition levels.

In 2024, we further enhanced the mandates of the GSC, the Chief Sustainability Officer and the Sustainability Centre of Excellence by amending the GSC’s procedural rules and establishing additional internal policies focusing, for example, on the reporting lines and agenda-setting of the GSC.

Sustainability governance structure

■ Supervisory oversight ● Risk ● Positive impact ↓ Delegates
■ Overall responsibility ● Opportunities ● Negative impact

1 Responsibilities for material matters in our own operations: own workforce (HR), privacy of client data (COO), suitability of products (Compliance), social inclusion (SCE).

Environment

Through our double materiality assessment, we have identified four material environmental topics: climate change, pollution, biodiversity & ecosystems, and resource use & circular economy. The former two have been identified as material for risks, and the latter as material from an impact perspective. Below we will focus on the material risks.

Climate change

Climate-related policies

This section outlines the internal policies we have implemented to manage the material impacts, risks and opportunities in our value chain related to climate change.

At ABN AMRO, climate risk is integrated into our risk taxonomy, risk appetite and financial planning under sustainability risk. Our sustainability risk policy framework ensures that environmental risks are managed throughout the enterprise risk management cycle.

Our climate strategy supplements this framework by setting targets and initiatives to align our portfolio and operations with a net-zero trajectory and reduce GHG emissions. Various policies and standards manage climate risks. Our sustainability risk policy framework addresses climate change mitigation and the management of physical and transition risk, while also helping us to address our broader climate impacts. We are continuing to assess how to further develop our policies relating to the management of impacts and opportunities in the future.

Managing our operations

We aim to reduce the climate impact of our own operations. To achieve this, we have adopted policies targeting carbon emissions and energy use. The Environmental and Energy Policy is designed to reduce energy usage in our buildings and increase the use of renewable energy through changes to procurement practices. The Chief Operations Officer (COO) oversees the implementation of the policy. Similarly, the Travel and Mobility policy is focused on electrifying our lease fleet, reducing emissions from business travel, and encouraging alternative travel options. Implementation of this policy is overseen by the CHRO.

While these policies currently apply to operations in the Netherlands, we are working on extending them to other countries.

Climate strategy

Our climate strategy, introduced in December 2022, defines our approach to aligning with the global goal of limiting global warming to 1.5°C and supporting the transition to a net-zero economy by 2050. As part of our commitments under the Dutch Financial Sector Climate Agreement and the NZBA, we have prioritised sector-specific targets for high-emitting industries. The NZBA framework provides internationally recognised, science-based guidance for our decarbonisation efforts.

For sectors such as iron & steel, aluminium, cement and aviation, we have determined that our current financial exposure is not significant enough to set specific targets. However, we will continue to monitor these sectors and work with corporate clients to support their decarbonisation efforts.

This year, building on the priorities from our 2022 climate strategy, we have identified three decarbonisation levers that ABN AMRO uses to implement specific actions aimed at achieving climate targets for each sector. First, we engage with clients and offer financing solutions to support their journey to net zero. One example is our Transition Readiness Assessment tool, covering the majority of our climate strategy portfolio across six sectors and involving approximately 2,100 clients in 2024. Second, we ensure our processes and policies are aligned with net zero targets, enabling us to assess risks and challenges to meeting reduction targets and transition risks. This alignment is reflected in credit approval and capital allocation processes, which are continually evolving. A notable update in this respect is that we have updated the requirements for coal-fired power generation companies in the sustainability risk standard with client requirements, which commits to phasing out thermal coal by 2030. Lastly, we engage with industry and governments to raise awareness and promote sector-wide change, thus reinforcing our dedication to supporting our clients in their transitions.

Our approach

How the targets were set

We have set emission reduction targets and ambitions across our lending portfolios, operational activities and client asset portfolios, with a focus on responsibly reducing carbon intensity. No external stakeholders were involved in the target-setting process. Our approach to target-setting for the lending portfolio is built on three key elements:

- **Industry guidelines:** We align our targets with industry best practices, following guidelines such as the NZBA Climate Target Setting for Banks and the Partnership for Carbon Accounting Financials (PCAF) methodological guidance. This ensures our targets are consistent with our commitments to the NZBA and PCAF.
- **Science-based approach:** Targets are grounded in the methodologies, decarbonisation scenarios and data currently available, adhering to NZBA guidance.
- **Sector-based focus:** We adopt a sector-based approach to target-setting, recognising that each sector in the economy faces unique challenges in transitioning to net zero. By prioritising carbon-intensive sectors, as recommended by the NZBA, we aim to drive the most impactful decarbonisation of our portfolio.

To achieve our targets we rely on assumptions embedded in the underlying benchmarks, including the development of emerging technologies and shifts in consumer demand. The climate targets have not been validated by an independent external body. For setting ambitions related to our assets under management, we use the Institutional Shareholder Services (ISS) framework to guide our approach in measuring the climate impact within our investment portfolios. Our objective is to reduce the Weighted Average Carbon Intensity (WACI) of our clients' investment portfolios, specifically within the equity holdings of our DPM mandates.

Client engagement

Engaging with clients to support their transition to net zero is a cornerstone of our climate strategy and a critical component of our decarbonisation efforts. Risk assessment and measurement and Risk response sections above explain how we engage with our clients.

Overview of sectors and targets

ABN AMRO has set targets for carbon-intensive sectors that are material and significant to our organisation. Our approach is to define materiality by assessing sector exposures, considering sectors with drawn exposures of less than 0.25% of the corporate loan book as immaterial. For transparency reasons, all sector baseline values calculated are based on data from a single year, rather than on multi-year averages. This approach aligns with NZBA recommendations, which specify that baseline data should be no older than two years. Any subsequent significant changes to the baseline, such as those resulting from external factors or portfolio adjustments, will be reported.

In line with our climate strategy and our commitment to NZBA, we have set and published targets for several of the NZBA carbon-intensive sectors (agriculture, commercial and residential real estate, oil and gas, power generation, and transport). Our targets currently cover 95% of our total exposure to NZBA carbon-intensive sectors, based on the outstanding exposure captured (in gross carrying amount) by our climate targets divided by the exposure to the NZBA carbon-intensive sectors. The remaining 5%, which is not yet covered by a target, will either be incorporated into subsequent updates of our climate strategy or is excluded due to methodological assumptions.

We have chosen not to set specific targets for certain NZBA sectors because of their limited materiality. These sectors — iron & steel, aluminium and cement — make up a very small part of our exposure, collectively representing less than 1% of our total exposure to NZBA sectors, with each sector individually contributing less than 0.25%. We remain committed to monitoring the exposure to these sectors and will engage with clients in these sectors to support their decarbonisation efforts.

With regard to these targets, the selected decarbonisation pathways vary across sectors due to differences in portfolio characteristics, emission-generating activities, lending products and the chosen target type. For all sectors apart from agriculture and our ambition for client assets, we have chosen science-based benchmarks that are aligned with 1.5°C scenario reference pathways (including CRREM, the IEA and DNV), covering 93% of our total exposure to NZBA sectors. For agriculture, we have opted to align with the scientific calculations in the 2022 Climate and Energy Outlook of the Netherlands (Klimaat- en Energieverkenning, KEV) compiled by the Netherlands Environmental Assessment Agency (Planbureau voor de leefomgeving, PBL), which uses the IPCC Fifth Assessment Report (AR5) for GWP values and considers the implemented and proposed policies of the Dutch Coalition Agreement and its ability to fulfil the EU

FIT for 55 goals. The agricultural sector accounts for 2% of our total exposure to NZBA sectors. The scenario used for client assets is not yet science-based.

While we aim for alignment with these pathways, it is important to note that full 1.5°C alignment does not necessarily need to be achieved by 2030. This applies to residential mortgages, inland shipping, and road transport trucks and vans, where the intermediary target is above the benchmark line.

The year 2024 was the second year since the introduction of our climate strategy, and we continued to manage our portfolio and implement commercial initiatives in line with this strategy throughout the year. However, 2024 also represented a turning point as we moved into a new phase of our strategy. We are now refining and revising targets to reflect new information, such as additional available data, new climate strategy insights and updated methodologies. For more information on how we are progressing on the targets we have set per sector, please see our Integrated Annual Report 2024.

Climate risk identification, monitoring and reporting

ABN AMRO recognises climate change as a material risk. Climate risk is embedded in our risk taxonomy and risk appetite as part of sustainability risk. We measure and monitor our climate risk exposure periodically and evaluate whether our client portfolios remain aligned with our climate strategy. Below we zoom in on the climate risks in our client portfolios.

Climate risk heatmap

The environmental and social heatmap relating to climate risk evaluates the sensitivity of various sectors to climate-related physical and transition risks, including negative impacts.

For physical risks, sensitivity is based on a combination of sector characteristics, such as dependence on assets, labour and ecosystem services, as well as the regional and country-based exposure to hazards (such as flooding, heat stress and sea level rise). For our portfolio located in the Netherlands, we source exposure to flooding from the Climate Impact Atlas of Climate Adaptation Services (CAS), relying on 2050 projections, as well as from Encore (Exploring natural capital opportunities risks and exposure). For other hazards and geographies, we source sensitivity estimations from Moody's ESG Solutions, relying on projections to 2040. Both data sources assume a high emission scenario (Representative Concentration Pathway (RCP) 8.5 scenario).

Transition risk sensitivity is determined by the sector's greenhouse gas emission intensity (derived from PCAF and ISS Oekom sources), alongside various regulatory, technological and market parameters. The regulatory parameters are done at two levels:

- at a sector level, where we reference the annual sector reduction requirements in the Dutch Climate Agreement (focusing on projections to 2030)
- at a country level, where we refer to the most recent policy-induced emission reductions targets in the Environmental Performance Index

The chart below highlights sectors with moderately high or high sensitivity to one or more of the three key factors: physical risk sensitivity, transition risk sensitivity and negative impact.

The results of the heatmap show that the highest sensitivities (Moderately high and High) are in the agricultural (NACE A), mining (NACE B), manufacturing (NACE C), power generation (NACE D) and transport sectors (NACE H). The climate risk heatmap is available on our Integrated Annual Report 2024.

Climate risk-mitigating processes

Climate risk mitigation is carried out through our risk response process, as explained earlier under [Risk management of sustainability matters](#).

Climate scenario analysis, scenario choice and data

Our loans are concentrated in the Netherlands. Correspondingly, our material physical risk sits mainly in Dutch regions (referred to as NUTS, Nomenclature of Territorial Units for Statistics, the geographical division of the economic territory in the European Union). Our physical risk assessment covers our corporate loans, residential mortgages and

commercial real estate portfolios and constitutes 96% of our loan book collateralised by physical assets. For methodology of our physical risk assessment, please refer to ESG5.

In 2024, we performed climate scenario analyses on our residential and commercial real estate portfolios against several long-term (to 2050) climate change scenarios. These analyses assessed physical (e.g. floods, foundation problems, wildfires, heat stress) and transition (e.g. policy changes and technological shifts impacting industries) risk events and considered risks in climate adaptation plans. The underlying assumptions of the flood assessment reflected a high emission scenario (Representative Concentration Pathway (RCP) 8.5 scenario), where no additional efforts are made to constrain greenhouse gas emissions, resulting in a temperature increase of 4.3°C by 2100. The scenario analysis for residential real estate also included environmental risk. For the physical risk assessment, customers with high loan-to-value and loan-to-income ratios and/or a risk stage 2 (increased risk) classification during the past 12 months were defined as vulnerable, while collateral with an energy label of D or lower and market value of EUR 300,000 or lower was defined as vulnerable. The impact of CER risk events on customers' creditworthiness was assessed and calculated in terms of RWA and provision requirements. The outcomes of the assessment served as an input for the Credit and Liquidity risk CER materiality assessments.

Foundation problems are an important driver of physical climate risk in the Dutch real estate sector. Property-specific data on foundation risk is available from Kennis Centrum Aanpak Funderingsproblematiek (KCAF), a leading party in the Netherlands that generates granular data on this risk. This data is also included in property valuation reports for residential real estate. Data on the other drivers of physical climate risk (flooding, wildfires and heat stress) are obtained from Climate Adaptation Services (CAS), which provides data for the Netherlands at a highly granular level. The CAS data is partly based on the WH scenario to 2050 from the Royal Netherlands Meteorological Institute (the KNMI'14 scenarios). In the case of flood risk, CAS data is based on the new KNMI'23 scenarios. These represent the worst-case outcomes for climate change in the Netherlands and closely align with the Network for Greening the Financial System (NGFS) current policies scenario.

The climate scenario analysis results as published in our Integrated Annual Report 2024 show the risk distribution of our commercial real estate (CRE) and residential real estate (RRE) and portfolio exposures for four climate-related risks: foundation risk, flood risk, wildfire risk and heat stress risk. The analysis was performed by measuring the chances of the risk events occurring in the years to 2050 for buildings in the Netherlands. The probabilities of foundation problems are grouped into five buckets: no risk, low risk, medium risk, high risk and no available data.

Climate-related opportunities

Investments in equity and hybrid debt

As part of our climate strategy in 2022, a growth target was established for early-stage capital by 2030. The energy transition requires investing in early-stage companies that have climate change mitigation as a business objective. Many technologies that can drive the transition to a low-carbon economy either already exist or are being developed, but often face a financing gap between research and development, early-stage adoption and full-scale commercialisation. The equity division of corporate banking aims to provide the necessary capital to help these technologies scale up to achieve (broader) commercial application. By investing in these scale-up companies, we can accelerate the development, deployment and adoption of innovative decarbonisation solutions.

By 2030, up to EUR 1 billion will be allocated to accelerate the transition to a decarbonised economy. We started in 2022, with EUR 145 million, and the cumulative capital deployed so far totals EUR 333 million. In 2024, we deployed EUR 31 million in direct equity and allocated EUR 49 million to fund investments in progressing towards our EUR 1 billion early-stage capital target. No interim targets for capital deployment by 2030 have yet been set. Progress is monitored quarterly by the corporate investments management team, as well as by the climate strategy team. To provide clarity on our sustainability metrics, we relate them to key financial statement line items. In the statement of financial position these are primarily reflected in Other equity associates within Equity accounted investments and Financial investments. This funding is deployed through direct equity, fund investments and hybrid debt. Direct equity participations are made via the Sustainable Impact Fund (SIF), which focuses on three areas: the energy transition, built environment and sustainable consumption. While SIF emphasises these areas, we also invest in third-party climate-focused funds to ensure diversification in the climate transition. These are funds that are covered either by Article 8 or 9 in the Sustainable Finance Disclosure Regulation (SFDR) and whose objective is to address climate change and a just transition. Additionally, hybrid debt is offered to a select number of scale-up companies seeking to mitigate climate

change, with the target being innovative firms with near-term positive cash flows, and this assessment is made on a case-by-case basis.

Renewable energy and decarbonisation technologies

In 2022, as part of the climate strategy, a target was set for a lending commitment (drawn and undrawn amounts) of at least EUR 4 billion for renewables and decarbonisation technologies by December 2025 to support our clients' transition to green energy. In 2022, the baseline value of EUR 3.1 billion became part of our climate strategy, and we achieved our goal two years ahead of schedule, reaching a total commitment of EUR 5.4 billion by the end of 2024. Progress is monitored quarterly by management, as well as in the Group Sustainability Committee. In 2024, we increased our target for 2030 to EUR 10 billion.

The methodology to determine the financing in scope encompasses two components: renewable energy and decarbonisation technologies. Renewable energy covers activities, assets, infrastructure and projects in the field of and companies dedicated to the development, construction, installation, manufacturing, maintenance, operation of and/or advice on renewable energy sources and storage techniques. Decarbonisation technologies are activities related to renewable energy generation, manufacturing of hydrogen, energy storage, clean transport and infrastructure deals across ABN AMRO Corporate Bank's financing activities and which are not already part of the renewable energy component.

To achieve our financing target for new energy, ABN AMRO is focusing on financing companies delivering products and services that are key for the energy transition. Leveraging our advisory expertise and financing capabilities, we are collaborating with new and existing clients to support a diverse range of solutions, including renewable energy generation, manufacturing of clean fuels, low-carbon hydrogen production, energy storage, clean transportation and related infrastructure.

Our own operations

The primary climate impact of our own operations stems from energy use and carbon emissions generated by day-to-day activities. While our influence as a bank is much greater through the financing of business activities and models, we remain dedicated to minimising our own operational footprint.

We are ISO 14001-certified for Environmental Management Systems, thus ensuring continuous monitoring, updates and the implementation of control measures to address climate risks and opportunities in our own operations. Significant risks and opportunities are assigned to owners, and relevant stakeholders are actively engaged. A dedicated team meets monthly to discuss climate issues, with quarterly reviews focused on identifying and addressing new risks and opportunities.

We have set a target for net-zero emission reductions by 2030. To achieve this, we measure, monitor and actively work to reduce GHG emissions across our operations.

- Energy efficiency and renewable energy deployment in our buildings
We are upgrading all our Dutch offices to energy label A and aligning their energy efficiency with the Paris Agreement. By 2030, our Dutch offices will consume less than 50 kWh per square metre annually. Additionally, we are transitioning to 100% renewable energy in all our offices, both domestically and internationally, while working to reduce overall energy consumption.

- Electrification and reduction of our mobility and business travel
To decarbonise mobility, we are electrifying our lease car fleet in the Netherlands. In 2018, we joined the Anders Reizen Coalition, a collaboration between 70 large Dutch organisations working to reduce emissions from commuting and business travel.

Internationally, we are implementing policies to ensure only electric vehicle options for lease fleets. This approach is already in place in the Netherlands, Belgium and Germany, while still pending in France and Greece. Since the electric-lease-car-only policy has not yet been implemented in the latter two countries, new gas or diesel car contracts initiated in 2025 could result in vehicle emissions in 2030 if these contracts span five years. We are actively exploring solutions to meet our target of a fully electric international lease fleet by 2030.

To decarbonise business travel, we are replacing short-distance air travel with rail travel, procuring sustainable aviation fuel and setting a maximum annual travel budget for each department. ABN AMRO has installed internal monitoring mechanisms and dashboards to allow departments to gain insight into their business travel behaviour and proactively steer on their maximum and remaining travel budgets. We are currently working on department-specific reduction plans. However, in 2023 and 2024 our business travel emissions exceeded what we strived for. Cascading travel budgets down to department level has not yet yielded the necessary results, but the matter has our continuous attention.

Nature: biodiversity, pollution and circular economy

We have identified the ESRS sub-topics of E2 (air and water pollution), E4 (drivers of biodiversity loss) and E5 (resource use and the circular economy) as material from an impact perspective through our double materiality assessment. From risk perspective, the material risk is assessed to be limited to pollution.

Cross-sector environmental scenario analysis

In 2023, ABN AMRO conducted a cross-sector environmental risk scenario analysis to assess the effects of environmental transition risks on our corporate lending clients in the Netherlands. Unlike climate risk, there are no globally accepted environmental risk scenarios. We therefore developed our own locally relevant scenario, guided by the Taskforce on Nature-related Financial Disclosure (TNFD). This scenario focused on transition risk and considered a time horizon to 2030.

Our scenario was based on existing European regulations and their implementation in the Netherlands. We focused on transition risks, which we deemed to be more relevant to our business in the short term, given the European and global policy context.

The analysis assumed that European water and air pollution regulations, along with nature conservation policies, would be strictly implemented and enforced in the Netherlands. This assumption was based on:

- compliance deadlines: many regulations have deadlines within this timeframe
- potential non-compliance: the Netherlands may not necessarily meet these deadlines
- strict enforcement: the European Commission has signalled that further delays will not be tolerated

Using sectoral environmental impact data from the Impact Institute and the Dutch Emission Registration, along with geographical data from the PBL Netherlands Environmental Assessment Agency and the National Institute for Public Health and the Environment, we simulated the costs and business continuity risks for our clients. Costs were calculated by internalising the external environmental costs of pollution, while business continuity risks were evaluated by assuming permit limitations for clients in high-impact sectors operating in highly sensitive natural areas.

The results indicated that water pollution-related costs and business continuity risks were most significant for clients in the manufacturing and agriculture sectors.

In relation to pollution risks, and specifically the Dutch government's nitrogen-reducing measures, we have taken management overlays.

As we continue to update our risk management framework in relation to environmental risks, the insights from this scenario analysis will inform ABN AMRO's strategic and risk management initiatives as follows:

- Stress-testing integration: Work is underway to incorporate environmental risk into the bank's stress-testing methodology and models.
- Agriculture Transition Plan: A transition plan for the dairy sub-sector is being drafted, outlining the bank's vision for the sector in 2040. This plan will include details of ABN AMRO's ambition and role, and an action plan to support clients transitioning to more sustainable and regenerative practices.

Social

Through our double materiality assessment of the Social standards, we have identified Own workforce, Workers in the value chain and Consumers and end-users as material.

Social risk heatmap

The social risk element of the environmental and social risk heatmap focuses on workers in the value chain. It examines the negative impacts of the sectors that our clients are active in and focuses on working conditions, equal treatment and opportunities, as well as other work-related rights. The results in the heatmap show that in 2024, the highest sensitivities (Moderately high and High) for workers in the value chain were mostly in the mining (B), transport (H), accommodation and food service activities (I) and financial and insurance activities (K) sectors. Most sectors scoring Moderately high or High have links to forced labour in their own operations and/or in their supply chain.

Own workforce

Based on the Double Materiality Assessment (DMA), we identified the impact of diversity and inclusion as the sole material matter in relation to our own workforce.

Policies related to own workforce

ABN AMRO has multiple policies in place to address material impacts on its own workforce. The three policies discussed in this section are the HR Risk Policy, Diversity & Inclusion Policy and the Behavioural Risk Policy. We also describe our human rights commitment related to our own workforce.

The policies mentioned below apply to ABN AMRO Bank N.V. and all subsidiaries, branches and representative offices under its control globally, regardless of location, role or seniority level, unless explicitly stated otherwise and/or subject to legal restrictions. The Executive Board (ExBo) is accountable for managing HR and behavioural risk across the bank, with day-to-day management responsibilities delegated to the Group Risk Committee (GRC).

HR Risk Policy

ABN AMRO defines HR risk as part of its risk taxonomy, which integrates into the bank's Enterprise Risk Management (ERM) framework. HR risk encompasses the potential challenges ABN AMRO may face in attracting, developing, and retaining the critical skills and diverse talent necessary to achieve its strategic objectives. This includes adhering to HR-related laws and regulations. Specific areas of HR risk cover discrimination, employee relations, health and safety, remuneration and employee suitability. The HR Risk Policy is applicable to employees, and where relevant to external and non-employees working with ABN AMRO through third-party suppliers.

The HR Risk Policy aims to adhere to the principles of the European System of Central Banks & the Single Supervisory Mechanism Equality and Inclusion Charter. This Charter commits ABN AMRO to a workplace free from discrimination and inappropriate behaviour, upholding both European Union and national laws. The HR Risk Policy also includes obligations for workplace accident prevention, aligning with local regulations in each of ABN AMRO's operational regions.

To guide employees in ethical behaviour, both within and outside the organisation, ABN AMRO emphasises its Code of Conduct alongside HR risk management policies. The HR Risk Policy also refers to Diversity and Inclusion (D&I) best practices in line with the Dutch Corporate Governance Code.

Diversity and Inclusion Policy

ABN AMRO's D&I policy is an integral part of our HR Risk Policy. This policy reaffirms the bank's dedication to fostering a diverse, inclusive and equitable workplace by promoting equal opportunities and focusing on preventing harassment and discrimination, as well as adherence to national and local labour and employment laws. The scope and accountability of the D&I policy align with those of the HR Risk Policy. For non-employees working with ABN AMRO through third-party suppliers, these principles are reinforced within the Supplier Code of Conduct.

Our D&I policy encourages equal treatment and opportunity across all areas of the organisation. This policy includes initiatives like the Diversity Circle and Diversity Table to promote inclusion and eliminate discrimination. Protected characteristics under this policy include gender, race, nationality, ethnicity, age, religion, disability, sexual orientation, union affiliation, political affiliation, and other statuses protected by applicable law.

ABN AMRO has integrated its D&I policy into various processes to promote inclusivity across the organisation. For example, the bank has taken steps to create gender-sensitive job advertisements to attract more responses from women and is refining its recruitment process to be more inclusive for female candidates. Additionally, ABN AMRO conducts annual surveys on equal pay for work of equal value. These surveys focus on identifying and addressing any disparities in opportunities or pay between women and men and among employees from diverse cultural backgrounds.

Behavioural Risk Policy

The Behavioural Risk Policy is designed to safeguard an enabling and supportive working environment, encouraging employees and external employees to align their actions with the bank's purpose – 'Banking for better, for generations to come' – and supporting ABN AMRO's core values: care, courage and collaboration, as outlined in our Code of Conduct. The Behavioural Risk Policy provides 'speak-up' channels for employees to share concerns and feedback. Furthermore, regular employee surveys and pulse surveys are held. These tools enable our own workforce to express needs and concerns directly within the organisation.

Commitment to Human Rights

Our Human Rights Statement applies to ABN AMRO employees, external employees and non-employees working with ABN AMRO through third-party suppliers. It aligns with international standards, including the UN Guiding Principles on Business and Human Rights, the OECD Guidelines for Multinational Enterprises, and the ILO Declaration on Fundamental Principles and Rights at Work.

To manage and mitigate human rights impacts, ABN AMRO has established a due diligence process. As an employer, the bank engages with its own workforce, whose human rights may be affected and consults with organisations that represent their interests. For example, the Employee Council and the European Staff Council directly represent employees in the bank's governance, and ABN AMRO maintains relationships with trade unions in countries where we operate, as applicable.

In the International Framework Agreement (IFA), the bank has pledged to respect ILO Conventions No. 29 on Forced Labour and No. 105 on the Abolition of Forced Labour, as well as Convention No. 182 on the Worst Forms of Child Labour. ABN AMRO addresses modern slavery, including human trafficking, in its Modern Slavery Statement.

Dialogue and engagement with our workforce

ABN AMRO has established multiple channels to engage with its own workforce on a wide range of topics. Key engagement processes include employee councils, employee surveys, and ongoing interactions with trade unions. Specific topics, such as employee development, performance, and personal circumstances, are often addressed through direct dialogue between employees and their line managers.

The D&I policy, accessible to our workforce, outlines the organisation's involvement in driving inclusive policies, interventions, and activities. Engagement with employees on D&I topics occurs through initiatives like the Diversity Table and Circles, ABN AMRO's internal networks, and forums for employee feedback, such as employee advice sessions, internal surveys, and colleague discussions. These engagement activities are conducted multiple times each year. The Executive Board (ExBo) is accountable for managing the D&I policy, with day-to-day management responsibilities delegated to the Group Risk Committee (GRC).

ABN AMRO is also a signatory of the International Framework Agreement (IFA) with the Dutch FNV trade union federation and the UNI Global Union. This agreement formalises the bank's commitment – and that of its suppliers – to uphold labour rights and its aim to ensure a workplace free from discrimination and harassment. The IFA Monitoring Committee, comprising ABN AMRO and trade union representatives, provides a platform for updates on the bank's adherence to the IFA and offers unions an opportunity to share workforce-related insights.

Employment conditions supporting environmental and social awareness

Various forms of variable remuneration apply within ABN AMRO. The award of individually linked variable remuneration is based on the employee's performance on predefined KPIs set at the beginning of the year. For CLA+ and CLA Identified Staff, sustainability is directly included in these KPIs via the Sustainability Assets and climate strategy, while for CLA staff, sustainability is included in the calculation of the pool for discretionary variable

remuneration. For the Executive Board, sustainability is taken into account via the Dow Jones Sustainability Index and climate strategy KPIs.

Our targets related to own workforce

ABN AMRO NL D&I targets for 2025:

Gender representation

- Ensure at least 48% of the Extended Leadership Team are women
- Target for 35% of senior and middle management positions to be held by women
- Set gender diversity targets for senior leadership positions within subsidiaries of the bank. For target setting at subsidiaries, please see our website¹.

Cultural diversity

- Achieve 8% of senior management
- 9% of middle management with a migration background.

Inclusion of vulnerable and underrepresented groups

- Support the participation of at least 225 people with a work-related disability
- Continue the annual hiring of 20 people with a refugee background.

Workers in the value chain

Through our DMA, we have identified two key sub-topics as material issues concerning workers in the value chain: working conditions and other work-related rights. When addressing human rights in this context, we focus on the following areas:

- Working conditions: this includes secure employment, fair working hours, adequate wages, social dialogue, freedom of association (such as the existence of works councils), collective bargaining, work-life balance, and health and safety.
 - Other work-related rights: this covers critical issues such as the prevention of child labour and forced labour.
- Within the spectrum of human rights, we focus our efforts on the most severe risks to people. Our most salient human rights risks are also assessed as part of the social risk heatmap, which informs the DMA. In 2020, we carried out a salience assessment and in 2022, we carried out a 'salience pulse check' to see whether the issues identified as salient continued to apply. In line with the salience assessment and pulse check, we have listed the salient human rights issues for our role as lender, investment services provider and procurer of goods and services. We then track the degree to which we are managing these salient human rights risks through our internal reporting. For example, we have quarterly reports that feed into the bank's key risk indicators (KRIs) on human rights. Following the UNGPs' recommendations, we will update our human rights saliency assessment in 2025.

As an internationally operating bank, we have exposure to a wide variety of sectors and countries, especially along our value chain. This potentially connects us to impacts on workers across our value chains, so we carefully consider the impacts, risks and opportunities associated with potential business opportunities. We have developed policies to manage risks for specific high-risk sectors and have an exclusion list for activities that we want to avoid financing altogether.

As highlighted in our DMA, we have identified our impact on value chain workers to be material in our financing activities, focusing our efforts on the downstream side of our value chain. However, since our activities cover all value chain workers in order to ensure a comprehensive approach, this disclosure also includes our perspectives in our role as a procurer of goods and services to the extent required.

In the downstream part of the value chain, for our corporate loans portfolio, the social risk element of the social risk heatmap focuses on negative human rights impacts on workers in the value chain. In 2024, we identified where the risks of child labour and forced labour are more likely to arise within sectors in our corporate loan portfolio.

Policies related to value chain workers

Social risk is incorporated in the Sustainability Risk Management Framework and the Sustainability Risk Policy. In our efforts to manage our impacts in the downstream part of the value chain, we are guided by key international human

¹ Please refer to [D&I Target-setting](#) on our website for further information.

rights standards, such as the UN Guiding Principles on Business and Human Rights, the ILO Declaration on Fundamental Principles and Rights at Work, and the OECD Guidelines for Multinational Enterprises.

The relationship manager (first line of defence) is primarily responsible for our clients' compliance with the bank's standards and human rights commitments, which is a continuous effort. The first line will also actively engage with our clients on all ESG topics, including human rights issues, where we see that our clients' performance needs improvement. This process is overseen by the second line risk sustainability department within Credit Risk, among others.

Code of conduct / Supplier code of conduct

As a procurer of goods and services, ABN AMRO ensures that our suppliers meet high ethical standards through our Code. The document outlines the bank's expectations for suppliers to respect the labour rights of their workers and to operate with integrity, fairness and respect for people and the environment across their value chains. Suppliers need to comply with relevant laws, regulations and standards (including OECD guidelines, UN Guiding Principles on Business & Human Rights, ILO conventions, OHSAS and ISO) in the jurisdictions where they operate.

The Code is a mutual agreement, and failure to adhere to its provisions may impact a supplier's relationship with ABN AMRO. The bank is dedicated to upholding these principles and ensuring its procurement processes reflect ethical and sustainable business practices.

Responsibility for overseeing compliance with the Supplier Code of Conduct rests with the Chief Procurement Officer (CPO), who holds the most senior-level accountability within the bank.

In 2024, ABN AMRO reviewed the Code to ensure alignment with its broader commitments to human rights. The updated version explicitly addresses critical issues such as worker safety, precarious work, human trafficking, forced labour and child labour.

Dialogue and engagement with value chain workers

As part of our commitment to human rights, ABN AMRO strives to engage with potentially affected value chain workers, their legitimate representatives or credible proxies. While our role as a financial institution means we have an indirect impact on the lives of these workers, the difficulty involved in making direct contact with individuals in our value chain adds complexity to our engagement efforts, especially in engaging directly with value chain workers. Being further removed from risks and impacts does also impact our leverage. We engage with our clients and suppliers to better understand the potential or actual negative impacts on the value chain workers.

As in most cases it is not feasible to directly engage with value chain workers, we adopt alternative strategies to ensure their voices are represented. We consult credible proxies, such as NGOs and trade unions, that provide valuable insights into the human rights risks associated with our lending and investment activities. These insights are used to enhance our risk assessments and inform due diligence processes.

Our approach to engagement with workers in the value chain also differs between the various roles of the bank as a procurer of goods, lender or investment service provider. We have therefore outlined our approach to engagement in more detail in the next sections.

In late 2024, as part of our policy review process, we initiated consultation rounds with expert NGOs specialising in various domains, including human rights. These consultations were designed to gather their perspectives on sustainability considerations, with a particular focus on the positive and negative human rights impacts affecting vulnerable groups such as mining workers. The consultation process was managed by a specialised team including colleagues with expertise in environmental, biodiversity and social issues. This team coordinated roundtable discussions to ensure a comprehensive understanding of potential human rights impacts and opportunities, contributing to more effective prevention and mitigation strategies.

Engagement in our role as a lender

We acknowledge that direct engagement with workers in the value chain is challenging. As a lender, most of our engagement activities relating to workers in the value chain occur through interactions with our clients facilitated by

our CASY tool, which includes human rights-related questions. More information on CASY can be found in the Risk assessment and measurement section of this report.

While this form of engagement is essential, we acknowledge that it does not equate to direct engagement with workers in the value chain. For sectors classified as high-risk from a human rights perspective, our KYC procedures require clients to provide additional documentation. When necessary, we engage with these clients to obtain all relevant information and ensure compliance with our standards. Risk response (step 4) of [Risk management of sustainability matters](#) explains further.

Engagement in our role as an investment services provider

As an investment services provider, we engage with businesses within our sphere of influence on their own stakeholder engagement practices. We also maintain regular discussions with civil society organisations to address human rights risks connected to our investment activities.

As a member of the Platform Living Wage Financials (PLWF), we actively engage with companies on living wage issues, demonstrating our commitment to promoting fair labour practices. These efforts reinforce our broader focus on supporting ethical and sustainable business practices through our investment services.

Most of our engagement activities in our role as investment services provider are carried out by EOS at Federated Hermes Limited or through our subsidiary, ABN AMRO Investment Solutions.

Engagement in our role as a procurer of goods and services

ABN AMRO is dedicated to respecting labour rights as part of its role as a procurer, in line with the International Framework Agreement (IFA) signed with the Dutch FNV trade union federation and UNI Global Union. The IFA monitoring committee, consisting of representatives from ABN AMRO and the trade unions, serves as a platform for the bank to update on compliance efforts and allows trade union representatives to share insights, ensuring that employee and value chain worker perspectives are considered.

In our Integrated Annual Report 2024, we provide more information on how we enable access to remedy for value chain workers and our approach to action for value chain workers.

Tracking performance

While formal targets have not yet been established, we currently track the effectiveness of our policies and actions by assessing how well we exercise leverage with corporate clients and businesses in our investment sphere of influence. These assessments provide valuable insights into the impacts and risks associated with our engagement efforts.

The development of metrics and targets is still in its early stages and will be guided by a gap analysis and a roadmap informed by the CSRD exercise. We are dedicated to progressing this work and anticipate being able to share more detailed information in our next integrated annual report.

ABN AMRO grievance mechanism

ABN AMRO is committed to meeting the expectations set by the United Nations Guiding Principles on Business and Human Rights (UNGPs). We know that people can experience adverse human rights impacts in connection with our activities. In each of our roles, there are mechanisms in place for potentially affected people to turn to. This ecosystem explains the different grievance mechanisms and speak-up channels per role and specifies who can raise a complaint through the mechanisms.

Consumers and end-users

Through our double materiality assessment, we have determined three material matters that relate to our consumers and end-users and reinforce our dedication to their overall well-being and inclusion. These are privacy, suitability of our products and services and social inclusion.

Addressing human rights issues arising from our consumers' activities

We are dedicated to respecting the human rights of all people that can be affected by our operations and those of our business relations. We have adopted dedicated statements on human rights and financial inclusion that guide our work, and we are committed to the relevant international human rights standards, such as the UN Guiding Principles on Business and Human Rights, the ILO Declaration on Fundamental Principles and Rights at Work and the OECD Guidelines for Multinational Enterprises.

ABN AMRO follows the human rights due diligence approach prescribed by these international standards. To achieve this, we engage with consumers and end-users (or their legitimate representatives or credible proxies), as described in the Dialogue and engagement section of the Integrated Annual Report 2024. When any negative human rights impacts that we are contributing to or are directly linked to are identified, we provide or enable access to remedy according to our complaints mechanism for consumers, outlined in the Complaint mechanisms and remediation channels section of the Integrated Annual Report 2024. We also describe there how we identify and manage our (potential) negative impacts on human rights related to consumers and end-users.

As part of our commitment to upholding the UN Guiding Principles on Business and Human Rights, the ILO Declaration on Fundamental Principles and Rights at Work, and the OECD Guidelines for Multinational Enterprises, ABN AMRO engages with various departments and individuals who work closely with clients, as well as the Legal Complaints Management team, to identify any reports of human rights violations and identify human rights risks or impacts. To our knowledge, no such cases have been reported.

Policies related to consumers and end-users relating to privacy

Our Personal Data Policy outlines the minimum standards that all staff must follow when processing personal data. It describes the principles and requirements that govern each stage of the data lifecycle, from collection through to erasure. This policy is grounded in the principles of the EU General Data Protection Regulation (GDPR), which have been adapted into ABN AMRO-specific sub-principles and translated into detailed requirements. It also implements relevant parts of ABN AMRO's Binding Corporate Rules (BCRs), which aim to contribute to affording an adequate level of protection to personal data transferred from ABN AMRO's EU entities to entities outside the EU.

Together, the Personal Data Policy and the BCRs set minimum standards for handling personal data across ABN AMRO.

The Personal Data Policy includes specific requirements for notifying consumers of personal data breaches, facilitating the exercising of their rights and enabling them to file complaints. It also refers to the Complaints Management Policy to support the latter.

Policies related to consumers and end-users relating to suitability of products and services and social inclusion

We have a set of policies in place to manage our risks impacting our consumers and end-users.

Product Approval and Review Policy

ABN AMRO's Product Approval and Review (PAR) Policy is designed to ensure that our products and services serve the best interests of clients and are offered to a defined target market, while considering all relevant risks for clients, the bank and external stakeholders. This includes, among other aspects, the inclusivity and suitability of our offerings.

The PAR Policy outlines minimum standards for approving, reviewing, and modifying new and existing products and services and related processes and systems, as well as exceptional transactions. It mandates that products be adapted to reflect macroeconomic, social and sustainability changes and that they comply with all relevant regulations. Additionally, the policy aligns with the bank's Client Centricity Principles and ESG objectives, supporting the Bank's broader risk strategy and risk appetite.

The ExBo holds ultimate accountability for managing product approvals and maintaining an effective PAR process, with the GRC assigned responsibility for oversight.

Duty of Care and Client Centricity Policy

The Duty of Care and Client Centricity (DoC & CC) Policy, introduced in June 2024, establishes our approach to managing Duty of Care (DoC) Risk and prioritising clients' interests across all areas of ABN AMRO. This policy aligns with the bank's Client Centricity Principles, purpose, core values and strategy.

Serving as an umbrella policy, it provides a structured framework for DoC & CC policies and controls. The DoC & CC Policy includes:

1. definitions and scope for DoC Risk and Client Centricity
2. key concepts and aspects of DoC Risk management
3. bank-wide requirements to integrate DoC Risk into the ERM management cycle

Oversight is assigned to the Management Body and Senior Management under the ERM Policy.

Client Categorisation, Suitability and Appropriateness Policy

The Client Categorisation, Suitability and Appropriateness Policy establishes minimum standards for providing investment services, performing investment activities, and delivering ancillary services. This policy details how clients are classified and when suitability and appropriateness assessments are required to ensure our products and services meet client needs.

The Compliance department holds an independent mandate to establish and review the bank's Client Categorisation, Suitability and Appropriateness Policy.

Complaints Management Policy

The Complaints Management Policy provides a structured approach to improving our products and services by ensuring effective complaint handling and registration. This policy outlines clear definitions of complaints, specifies roles and responsibilities, and sets standards for timely and accurate resolution. Additionally, it mandates a regular analysis of major complaint causes to drive continuous improvement and ensures adherence to all relevant complaints handling laws and regulations.

The Complaints Management department within Legal holds an independent mandate to develop, review and oversee the bank's Complaints Management Policy. This department also maintains overall ownership of the complaints handling process within the bank.

All the policies mentioned in this section apply to ABN AMRO Bank N.V. and all its controlled subsidiaries, branches and representative offices globally, unless otherwise specified. They are applicable to all locations, roles and seniority levels. Where local requirements are stricter, these will take precedence. Any deviations from any of the policies mentioned above must be approved and recorded according to the requirements outlined in the Policy on Policies.

Dialogue & engagement with consumers and end-users relating to privacy

The bank's primary focus with regard to engagements on privacy is on reactive engagement channels to handle data breaches, privacy complaints, and GDPR-related rights requests. In the event of a data breach, ABN AMRO follows a strict protocol notifying internal teams within 24 hours and safeguarding external regulatory notification within the required 72-hour window. Consumers may report breaches by phone or email or directly to the regulator. Although notification to affected clients is not always mandated, the bank generally informs them of relevant breaches. The complaints process, detailed in the section on the [ABN AMRO's grievance mechanism](#) aims to resolve privacy-related issues in a timely manner.

Dialogue & engagement with consumers and end-users relating to suitability of products and services and social inclusion

In our daily interactions with clients, we actively seek feedback to continually refine our services. To deepen our understanding of client perspectives and needs, we engage on an ad hoc basis with various stakeholders – conducting roundtables, surveys, client panels and pilot programmes. For example, this year we ran a pilot in partnership with an external company to test a new payment feature with a small group of clients. We also use insights and feedback from client behaviour to better align our offerings with client preferences and needs.

Our engagement approach varies depending on the type of interaction, as well as the function and seniority of the roles overseeing each interaction. For instance, the Customer Digital Engagement department has worked both directly and with third-party researchers to gather insights on clients' experiences, such as booking appointments online, accessibility of processes and services and sustainability expectations. Additionally, when organisations like the Dutch consumers' association Consumentenbond reach out to us with insights from their consumer surveys, we take these into account.

Our objective is to leverage client and stakeholder feedback to enhance our products and services, ensuring they effectively address client needs. Engagements help us assess the suitability of our offerings, and we also use product approval reviews to evaluate whether products and services remain valuable for their target markets. This process includes conducting scenario analyses and incorporating product-related complaints into our feedback loop, allowing us to refine product characteristics and target market definition.

Engagement with specific groups of consumers and end-users

We focus on specific client groups who may face barriers, including women, clients from culturally diverse backgrounds, elderly clients, those facing financial stress, individuals with disabilities, clients less familiar with digital tools, and young people. Engagement with these groups includes market research, client panels, and closed feedback loops. In 2024, we engaged with specific groups such as culturally diverse clients, women and individuals with disabilities. For example, we proactively consulted clients with physical disabilities to assess and improve the accessibility of our products and services. We also gathered valuable insights through focus groups, surveys, and one-on-one interviews with clients from diverse backgrounds to understand their unique experiences with banking services.

Grievance mechanisms and remediation channels for consumers and end-users

Under ABN AMRO's official complaints procedure, clients can submit complaints via the website, using our online chat facility, by calling or through the app. This procedure, part of our broader complaints ecosystem, is open to any complaints clients may wish to raise, including those related to accessibility, suitability, discrimination and use of our products and services. We provide an initial response within five days, including the name of the expert handling the complaint, the expected response date, and a contact number for any follow-up questions. If needed, complaints may be escalated to our second line Security and Integrity Management (SIM) team, who will follow up directly with the client.

If clients have not received a response within eight weeks after submitting a complaint, they can contact Kifid, the Dutch Institute for Financial Complaints, or Meldpunt Discriminatie. Furthermore, if a client is unsatisfied with the proposed solution, they can request a reassessment by the bank. If the Complaints Management department decides against a reassessment, the client still has the option to escalate the issue.

To measure the effectiveness of our complaints channels, we invite clients to provide feedback through a survey, which generates a journey Net Promoter Score (jNPS) as well as qualitative feedback. This feedback helps us refine the complaints handling process and improve outcomes.

Feedback from this mechanism is part of our closed feedback loop, informing continuous product and process reviews. Relevant stakeholders, including product and client units, have access to the complaints dashboard, allowing teams to follow up directly on complaints.

The Complaints Management team within Legal also reports quarterly to the ExBo and other stakeholders on complaint trends, helping us identify key issues and consider potential solutions.

If a complaint highlights specific aspects of one of our products, it can trigger the PAR process to evaluate the product's suitability and accessibility. As a result of this evaluation, products and services may be adapted as necessary.

ABN AMRO also expects its suppliers to maintain an effective complaints mechanism aligned with our Supplier Code of Conduct, which includes a dedicated complaints desk and continuous monitoring of complaint statuses. For intermediaries, legal arrangements ensure that complaints related to ABN AMRO products or services are handled appropriately. Clients who purchase our products through intermediaries or third parties can directly access our complaints mechanism for any issues. In all cases, complaints regarding our products or services will ultimately be handled by ABN AMRO. Moreover, ABN AMRO's Whistleblower Policy protects clients as well as third parties against retaliation, ensuring they can raise concerns without fear of adverse consequences. It is worth noting that the Complaints channel mentioned in the [ABN AMRO Grievance Mechanism](#) is separate from the whistleblowing channel.

Our approach to consumers and end-users relating to privacy

We take the following approach and actions to address impacts and risks on privacy, suitability of products and services and social inclusion:

- Strengthening privacy foundations with the expansion of the first line of defence
- Privacy programme implementation
- Further improvement of privacy management
- Developing enhanced privacy risk management insights

Our approach to consumers and end-users relating to social inclusion

ABN AMRO strives to minimise negative impacts on access to financial products and services by improving client due diligence and risk assessments. This reflects our ongoing efforts to maintain an inclusive financial environment. Below are some of the actions we perform to foster social inclusion:

- Research into barriers experienced by culturally diverse customers
- Building employee awareness of unconscious biases
- Enhancing accessibility of products and services
- Collaborations with other organisations

We monitor the effectiveness of our actions through various controls, testing, and tools. The resulting data is integrated into key risk reports and assessments.

Targets related to consumers and end-users

In 2024, ABN AMRO did not have specific targets for social risk topics. In 2025, we will be exploring whether setting such targets would be feasible as well as meaningful.

Business conduct (Governance)

We are subject to strict regulatory requirements, at both national and international level. These requirements are translated into internal policies for which mechanisms are in place to monitor operational effectiveness and compliance. The mechanisms enhance risk awareness and effective risk management, fostering a culture of integrity.

Through our materiality assessment of business conduct topics, our activities relating to Client Integrity are identified as material. We are aware that our role as a bank requires us to remain vigilant in order to safeguard the integrity of the banking system.

Client integrity

Client Integrity risk at ABN AMRO encompasses six key risk types: Anti-Money Laundering, Anti-Bribery and Corruption, Combating the Financing of Terrorism, Tax, Fraud and Sanctions. These forms of financial crime have a profound impact on society and the communities we serve. Our key stakeholders in this area include clients, regulators, employees, shareholders and society at large. Following the DMA, Client Integrity was identified as a material topic from a financial materiality perspective.

While ABN AMRO operates in a highly regulated environment and is subject to strict legal requirements, we also feel a need to play a role in the fight against financial crime and we attach great importance to conducting business with integrity.

Our policies relating to Client Integrity strengthen our dedication to adhering to our legal obligations (such as the Dutch Financial Supervision Act, the Dutch Anti-Money Laundering and Anti-Terrorist Financing Act and the Dutch Sanctions Act 1977), adopting industry best practices and fostering a positive culture to mitigate and manage financial crime risk. The Client Integrity-related policies are key to the bank's compliance framework. ABN AMRO has implemented several Client Integrity-related policies.

The Client Acceptance and Anti-Money Laundering (CAAML) Policy aims to protect ABN AMRO's products and services from being used for money laundering and financing of terrorism (ML/FT). The CAAML Policy establishes the measures and requirements by which ABN AMRO seeks to prevent and detect ML/FT, as well as the principles and rules by which ABN AMRO mitigates and manages these risks.

The Anti-Bribery and Corruption (ABC) Policy defines ABN AMRO's framework for managing bank-wide bribery and corruption risks regarding the bank's clients, its employees and organisation, and third parties. The purpose of the ABC Policy is to protect ABN AMRO from any involvement in bribery or corruption by the bank's entities, its employees, clients (and clients' relevant third parties) or third parties with whom the bank has a relationship. Regarding Client Integrity, the policy describes several indicators that increase clients' bribery and corruption risks (e.g. adverse media). The Tax Policy outlines the tax framework within which ABN AMRO operates. It defines the global tax mandate, provides specific guidance on responsible tax behaviour, defines the bank's tax strategy and states where and when the involvement of Group Tax is mandatory. It also describes the bank's tax risk appetite and provides guidance for tax risk management, including the tax control framework.

The Fraud Risk Policy defines the minimum standards and requirements for safeguarding the bank's risk profile in relation to the risk of fraud, including first-party fraud (i.e. fraud conducted by a client and leading to financial losses and/or reputational damage). The policy enables improved efficiency and efficacy in ABN AMRO's fraud risk management and seeks to ensure a proactive approach to managing fraud risk through fraud prevention, fraud detection and fraud response. This policy has been implemented in a comprehensive framework designed to adapt to the rapidly changing fraud landscape.

The Sanctions Policy aims to protect ABN AMRO's products and services from being used for prohibited transactions and for the purposes of evading, avoiding or otherwise circumventing sanctions. The Sanctions Policy describes the rules and requirements, consequences for non-compliance, escalations and reporting.

All ABN AMRO policies are available on the bank's intranet, in the policy framework section, and are shared with the relevant internal stakeholders. An AML, CTF and Sanctions Statement and the ABC Policy are publicly available on

ABN AMRO's corporate website. Processes and/or control frameworks are in place including policy adherence indicators and key controls to periodically monitor and test the implementation and effectiveness of the policies.

The policies apply globally to all ABN AMRO entities (including majority-owned subsidiaries and branches). However, where local laws and regulations are more stringent, the local laws and regulations prevail. Additionally, the ABC policy extends to employees and third parties with whom ABN AMRO has a relationship or who perform activities on behalf of ABN AMRO.

ABN AMRO requires its employees to understand their role in preventing money laundering and combating the financing of terrorism, as well as to know what to do if they encounter a situation that is not in line with our policy, and the steps to take from there. To support these employees, a curriculum of Client Integrity training is available, in addition to the ongoing Client Integrity training for all staff.

In April 2021, ABN AMRO agreed to a settlement with the Netherlands Public Prosecution Service regarding shortcomings in the bank's AML processes in the Netherlands. To address these shortcomings, ABN AMRO is continuing to enhance its internal AML processes and systems for the prevention of financial crime. Additionally, ABN AMRO is dedicated to increasing the effectiveness of its measures and is working towards an adequate and sustainable level that meets regulatory AML requirements. Currently, the main attention is focusing on the effectiveness of our monitoring processes and the quality of our client due diligence. ABN AMRO engages in ongoing dialogue with the Dutch Central Bank. The Dutch Central Bank is regularly informed, continues to monitor progress and provides observations. DNB has recently identified shortcomings in our event-driven review processes. These shortcomings relate to updating of client files, for example due to changes in a client's circumstances. DNB has indicated that these findings may lead to enforcement measures. A potential financial impact cannot be reliably estimated, and no provision has been recorded.

Bribery and corruption

ABN AMRO plays an important role in helping protect the wider financial system against bribery and corruption. In addition to our initiatives focused on Client Integrity, we also focus on employees and third-parties, and are looking to improve relevant internal policies, processes and controls and to ensure regulatory compliance and minimise risks for the bank and its stakeholders. More information is available in our Integrated Annual Report 2024.

Governance risk related to our counterparties

Our non-financial risk management looks after governance risks relating to our counterparties, such as fraud, third party and outsourcing risk. More on this can be read under EU ORA – Qualitative information on operational risk. Governance risk related to our clients is addressed as part of our client assessment on sustainability, which is disclosed under 'Risk management of sustainability matters' earlier in this section. The Client integrity section highlights how we manage governance risks related to our clients.

We report any violation of the Anti-Bribery and Corruption (ABC) Policy by staff or third parties, and any suspicions of bribery and corruption related to our clients, internally as well as to the relevant regulatory bodies. An unacceptable risk of corruption may lead to a prospective third party or client being rejected or, in the case of existing relationships, the relationship being terminated.

ESG1 - Banking book- Climate Change transition risk: Credit quality of exposures by sector, emissions and residual maturity

The table below shows the bank's exposure to non-financial corporates in carbon-related sectors, as well the scope 1, 2 and 3 emissions of our counterparties. Compared to 30 June 2024, the bank's exposure to sectors contributing to climate change decreased to EUR 46.7 billion (30 June 2024: EUR 48.3 billion). This explains a large part of the decrease of the financed emissions for corporate loans, which amounted to approximately 20.6 mtCO₂e on 31 December 2024 (30 June 2024: 22.8 mtCO₂e). The main contributors to the increase in GHG emissions are the mining and quarrying sector and real estate activities.

Data sources and methods are still developing. Below, we will highlight the main data sources and the methodologies applied.

	A	B	C	D	E	F	G	H

1. In accordance with the Commission delegated regulation (EU) 2020/1818 supplementing regulation (EU) 2016/1011 as regards minimum standards for EU Climate Transition Benchmarks and EU Paris-aligned Benchmarks - Climate Benchmark Standards Regulation - Recital 6: Sectors listed in Sections A to H and Section L of Annex I to Regulation (EC) No 1893/2006.

2. In accordance with points (d) to (g) of Article 12.1 and in accordance with Article 12.2 of Climate Benchmark Standards Regulation.

3. The rows of the template do not include Sector I, because of an inconsistency between the template and the regulation: sector I is not part of the Sectors that highly contribute to Climate Change, as specified in Recital 6 of the Commission Delegated Regulation (EU) 2020/1818. For this reason the exposures to Sector I have been included in the "Exposures to other sectors" row.

1. In accordance with the Commission delegated regulation (EU) 2020/1818 supplementing regulation (EU) 2016/1011 as regards minimum standards for EU Climate Transition Benchmarks and EU Paris-aligned Benchmarks - Climate Benchmark Standards Regulation - Recital 6: Sectors listed in Sections A to H and Section L of Annex I to Regulation (EC) No 1893/2006.

2. In accordance with points (d) to (g) of Article 12.1 and in accordance with Article 12.2 of Climate Benchmark Standards Regulation.

3. The rows of the template do not include Sector I, because of an inconsistency between the template and the regulation: sector I is not part of the Sectors that highly contribute to Climate Change, as specified in Recital 6 of the Commission Delegated Regulation (EU) 2020/1818. For this reason the exposures to Sector I have been included in the "Exposures to other sectors" row.

1. In accordance with the Commission delegated regulation (EU) 2020/1818 supplementing regulation (EU) 2016/1011 as regards minimum standards for EU Climate Transition Benchmarks and EU Paris-aligned Benchmarks - Climate Benchmark Standards Regulation - Recital 6: Sectors listed in Sections A to H and Section L of Annex I to Regulation (EC) No 1893/2006.

2. In accordance with points (d) to (g) of Article 12.1 and in accordance with Article 12.2 of Climate Benchmark Standards Regulation.

3. The rows of the template do not include Sector I, because of an inconsistency between the template and the regulation: sector I is not part of the Sectors that highly contribute to Climate Change, as specified in Recital 6 of the Commission Delegated Regulation (EU) 2020/1818. For this reason the exposures to Sector I have been included in the "Exposures to other sectors" row.

Impairments amount are shown as negative numbers.

1. In accordance with the Commission delegated regulation (EU) 2020/1818 supplementing regulation (EU) 2016/1011 as regards minimum standards for EU Climate Transition Benchmarks and EU Paris-aligned Benchmarks - Climate Benchmark Standards Regulation - Recital 6: Sectors listed in Sections A to H and Section L of Annex I to Regulation (EC) No 1893/2006.

2. In accordance with points (d) to (g) of Article 12.1 and in accordance with Article 12.2 of Climate Benchmark Standards Regulation.

3. The rows of the template do not include Sector I, because of an inconsistency between the template and the regulation: sector I is not part of the Sectors that highly contribute to Climate Change, as specified in Recital 6 of the Commission Delegated Regulation (EU) 2020/1818. For this reason the exposures to Sector I have been included in the "Exposures to other sectors" row.

Companies excluded from the Paris Aligned Benchmark

Under Article 12.1 of the Commission Delegated Regulation (EU) 2020/1818, the identification of companies excluded from EU Paris aligned benchmarks should be done on the basis of revenue split. As many of our counterparties do not yet report on their revenue split per sector, these exposures were identified based on the NACE code of the counterparty's principal activity. The NACE codes used to identify such organisations were: B05.10, B05.20, B06.10, B06.20, B09.10, C19.20, C20.11, D35.11 (except for clients whose principal activity is renewable energy or whose loan specifically finances a renewable energy project), D35.21, D35.22 and D35.23.

With regard to Article 12.2, the identification of such companies was performed using the CASY assessment tool as a proxy for the DNSH (Do No Significant Harm) assessment, given the lack of a structural assessment at company level, to detect whether a company has done significant harm to one or more of the environmental objectives referred to in Article 9 of Regulation (EU) 2020/852 of the European Parliament and of the Council.

Financed GHG emissions

The financed GHG emissions have been calculated according to the Global GHG Accounting and Reporting Standard for the Financial Industry (PCAF, December 2022). The reported absolute emissions are proportional to the share of our exposure in the counterparty's total (company or asset) value. We estimate the emissions by combining various sources of information. The main sources are summarised below. As a general rule, we use client or collateral level information whenever available. For other exposures, we use economic emission intensities, based on dimensions relevant to the segment.

Portfolio	Sources	Method
Corporate loans – listed Bonds and Equity	ISS – ESG Direct emissions from client reports	Client reported emissions
Corporate loans – non-listed Netherlands	Statistics Netherlands (CBS)	Economic emissions intensity
Corporate loans – non-listed rest of world	PCAF emission factor database	Economic emissions intensity
Agriculture	Rijksdienst voor Ondernemend Nederland (RVO), International Dairy Federation, Statistics Netherlands (CBS)	Sector specific emission factor for dairy farming, Economic emissions intensity other subsectors
Shipping loans	Poseidon principles, CO2emissiefactoren.nl, Kennisinstituut voor Mobiliteitsbeleid (KiM)	Client reported emissions for the sea and coastal freight water transport, Economic emissions intensity for inland shipping and other subsectors
Oil and Gas – upstream and midstream	Rystad Energy, company disclosures, IPCC	Specific emission via third party provider (Rystad), emission factors from IPCC where possible
Power Generation	BP Statistics 2022, company disclosures, Open database of the Dutch government (www.overheid.nl)	Client reported emissions, estimates for average capacity factor
Road Transport	TRACCS and CE Delft	External emission factors per vehicle type
Commercial Real Estate	Rijksdienst voor Ondernemend Nederland (RVO), PCAF Database	Estimated building emissions based on building type and energy label
Residential Mortgages	Rijksdienst voor Ondernemend Nederland (RVO), Statistics Netherlands (CBS), Basisregistratie Adressen en Gebouwen (BAG)	Estimated building emissions based on building type, floor area and energy label

GHG emissions for corporate loans

The ISS ESG database is used as the source for collecting GHG emissions for our corporate clients. For corporate clients not covered by the ISS ESG database, we used the Statistics Netherlands (CBS) and PCAF databases, which provide country- and sector-specific carbon intensity information. For clients active in renewable energy production from solar power, wind power or hydropower, we used an emission intensity of 0 for scope 1 and scope 2 GHG emissions, as the nature of the activity already implies that no emissions are associated with these activities. For scope 3 GHG emissions, either client-specific information was used or, if not available, the CBS and the PCAF databases were used.

GHG emissions for agriculture

For dairy farming, a combination of the research paper Hospers et al. (2022), RVO (via StatLine) and International Dairy Federation was used to calculate a sector-specific emission factor. For all other agriculture sub-sectors, we used the CBS database, which provides country and sector-specific carbon intensity information.

GHG emissions for shipping loans

The Poseidon Principles framework has been used as our main source for collecting GHG emissions at vessel level for the sea and coastal freight water transport portfolio. ABN AMRO also collaborates with third-party providers like DNV to collect, review, process the data and calculate the performance of the vessels in our portfolio. The Kennisinstituut voor Mobiliteitsbeleid (KiM) and emissiefactoren.nl database was used as a source to collect GHG emissions for inland shipping cargo vessels. For all vessels not covered by the above-mentioned sources, we used the CBS and the PCAF databases, which provide country and sector-specific carbon intensity information.

GHG emissions for oil and gas - upstream and midstream

For the ABN AMRO portfolio, the carbon intensity metric measures the kg of CO₂e emissions for each barrel of oil produced, distributed or transported by each client we finance. ABN AMRO links client data (company specific disclosures) to carbon intensity and production data from Rystad to calculate the carbon intensity baseline and target.

IPCC was used for emissions factors related to combustion of fossil fuels. Appropriate proxies are used in instances where carbon intensity and production data are not available.

GHG emissions for power generation

For power generation, a combination of company disclosures, BP energy statistics 2022 and an internal database was used. Most of the emissions data used to measure and track our clients' emissions, was a combination of internal and public company disclosures. Wherever possible, data gaps were addressed using estimates, at times with external guidance, such as the average capacity factor of different sources of power generation in Europe taken from BP Energy Statistics 2022.

GHG emissions for road transport

We measure our financed emissions for trucks in grams of CO₂ associated with each transported tonne of freight per kilometre and our financed emissions for vans in grams of CO₂ per vehicle kilometre capturing the scope 1 GHG emissions. The scope 2 emissions for trucks and vans are calculated based on electricity consumption. TRACCS was used for vehicle activity for all countries and for emissions factors for the UK and Germany, while CE Delft was used for emissions factors for the Netherlands. For passenger cars, we rely on external emission factors, as well as average distances travelled, to calculate the financed scope 1 emissions associated with our portfolio, and we rely on external data on electricity consumption, as well as electricity grid intensity, to calculate the scope 2 emissions financed.

GHG emissions for commercial real estate and residential mortgages

For residential mortgages, the calculations are in line with the PCAF standard and based on floor area, energy labels and asset type. CBS data for energy consumption has been used to calculate CO₂ emissions. To convert the energy data into carbon emission data, the emission factors provided by CBS were used. An attribution factor at loan level has been applied; this is the ratio of the gross carrying amount and the property value at origination.

For the commercial real estate financing portfolio, the GHG emissions calculations (scope 1 and 2) are based on energy label and asset type, and the corresponding emission factors provided by the PCAF emission factor database.

Scope 3 emissions

As of 31 December 2023, we are reporting estimates of our clients' scope 3 emissions. They depend entirely on the environmentally extended input-output (EEIO) emission factors carbon intensities by industry as supplied by the PCAF. These emission factors have the lowest data quality score and are currently limited to upstream scope 3 GHG emissions only.

Percentage of portfolio derived from company-specific reporting

We have defined this as the percentage of gross carrying amount of the emissions calculated with a PCAF data quality score 1, 2 and 3, as all of these scores use company-specific inputs.

Maturity buckets

Exposures without stated maturity and for which the counterparty can determine the repayment date are reported in the 20 years bucket. The average weighted maturity has been estimated based on the average of each maturity bucket.

ESG2 - Banking book - Climate change transition risk: Loans collateralised by immovable property - Energy efficiency of the collateral

Specifically for loans collateralised by residential immovable property, the amounts attributed to EPC labels in this report consist of EPC labels under the old regulation (NEN7120, prior to 1 January 2021) and new regulation (NTA8800) as provided by Rijksdienst voor Ondernemend Nederland (RVO). While both old and new regulation EPC labels are considered 'official' in column H-N, only the new regulation EP score is considered 'official' in column B-G. The new regulation EPC label is provided with an accompanying EP score, while this is not the case for the old regulation EPC label where EP score is classified as estimated in column B-G.

As such, the attribution of gross carrying amounts to the EP score in row 5 column A subsequently columns B-G, are higher than the gross carrying amounts of the estimated EPC labels in row 1 column P-O.

For all loans collateralised by immovable property, in accordance with the instruction, the columns that show the EP score include official as well as estimated labels, while the columns that show the EPC labels only include official energy labels. All the exposures without an official EPC label are reported in the column 'Without EPC label of collateral'. This includes estimated energy labels for:

- buildings that are not required to have an energy label under the Regulation ("no label"), such as monuments
- buildings that are under development or not yet registered, for which the label cannot be estimated ("unknown label")
- buildings whose energy label is not known to ABN AMRO due to other reasons

As part of its climate strategy, ABN AMRO has set targets to reduce its carbon footprint. ABN AMRO continues to work towards this goal by seeking to increase the A and higher-than-A-labels and lowering the exposure to D-G energy labels. In line with this strategy, the distribution of official energy labels showed a slight improvement compared to Q2 2024, with an increase in official energy labels from 52% to 55%, the majority being A labels and 76% of the portfolio having an energy label of C or higher (30 June 2024: 74%).

The increase in the category official EPC label A and higher-than-A labels was partly a result of new inflow and migration from the lower-than-A labels to label A. New inflow usually has an official energy label, given that such a label is mandatory at the time of a sale or purchase transaction. In addition, new-build houses based on the Building Decree (Besluit Bouwwerken Leefomgeving) have at least an A+++ label.

ESG3 – Banking book - Climate change transition risk: Alignment metrics

This template aims to capture the bank's alignment efforts with respect to the objectives of the Paris Agreement for a selected number of sectors. The products and sectors disclosed in Template 3 are aligned with those currently covered in ABN AMRO's climate strategy, which are disclosed in our Integrated Annual Report (IAR). The IAR serves as our primary disclosure, where we provide comprehensive updates on our progress.

ABN AMRO takes a sector-based approach to target-setting, as we believe this is the most effective way to achieve decarbonisation of our portfolio, given that each sector in the economy faces specific challenges in transitioning to net zero. In doing so, we are prioritising carbon-intensive sectors, as prescribed by the NZBA. For each sector, we have taken those parts of the value chain that are most material from an emissions and exposure perspective. Therefore, the sectors and NACE codes disclosed in Template 3 align with those currently included in ABN AMRO's climate strategy.¹

Regarding the scope of counterparties included in Template 3, it is important to note that the EBA focuses on non-financial counterparties, while ABN AMRO's climate strategy encompasses all counterparties. Although the majority of sectors within the bank's climate strategy pertain to non-financial counterparties, some sectoral targets do include other types of counterparties. This explains the discrepancies in the reported gross carrying amounts between the two disclosures (Integrated Annual Report and Pillar 3 Report) for the various sectors. The most significant difference observed pertains to agriculture disclosures, as a substantial share of our agriculture portfolio is classified as households, which fall outside the scope of this template. Consequently, for these sectors, the emission intensity disclosed in Template 3 is lower than the figures reported in our Integrated Annual Report, and for agriculture it is even below our target. This discrepancy arises because the target is based on the full counterparty scope of our climate strategy.

Regarding product coverage, the products captured in the portfolio gross carrying amount of Template 3 are aligned with ABN AMRO's climate strategy. Consequently, debt securities and equity instruments are not yet encompassed by our climate strategy and therefore not integrated into the Template 3 disclosures. If debt securities and equity instruments are included in the scope of the climate strategy in the future, this will be reflected accordingly in Template 3.

The economic scenario outlining the decarbonisation pathway prescribed by the EBA is the International Energy Agency (IEA), which sets a benchmark per sector for a scenario towards Net Zero Emissions by 2050 (NZE 2050). It is important to highlight that our climate strategy employs sector-specific scenarios for our targets in respect of shipping, commercial real estate (CRE) and agriculture.

Power generation

Data reported directly by our clients is used to calculate the emissions intensity of the power generation portfolio. Due to different timings in reporting, we report our intensity figures with a year's delay to ensure that all data used for calculations are sourced from the same year. In Q4 2024 the emissions intensity of this portfolio was 3.5 kgCO₂/MWh. This intensity is well below the 2030 target and the distance to the IEA NZE2050 scenario is therefore 0%.

Fossil fuel combustion

Oil and gas upstream

Fossil fuel combustion includes our oil and gas upstream portfolio. Our commitments to these sectors decreased in 2024 to EUR 804 million. This is well below the 2030 target, meaning there is a distance (in %) to the NZE 2050 scenario of 0%.

Oil and gas upstream and midstream

Since our target for oil and gas upstream and midstream will be first published in the 2024 Integrated Annual Report, the processes to actively drive the target have only just begun. The operational emission intensity figures reported are done with one year's delay. Please refer to the Integrated Annual Report for additional information on the methodology for this portfolio.

¹ If additional sectors come into scope for ABN AMRO's climate strategy, they will be included accordingly in this template.

Automotive

Trucks and vans

Our targets for trucks and vans for road transport are based on our asset-based financing lease portfolio and were published in the 2024 Interim Report. The reported financed emissions intensity for trucks is 79.8 gCO₂/tkm and there is a distance (in %) to the NZE 2050 scenario of 31%. The reported financed emissions intensity for vans is 218.6 gCO₂/vkm and there is a distance (in %) to the NZE 2050 scenario of 55%.

Passenger cars

Our target for passenger cars is based on our asset-based financing direct lease portfolio as well as our ALFAM consumer loan portfolio. Since the target will be first published in the 2024 Integrated Annual Report, the processes to actively drive the target have only just begun. The figures reported are based on the 31 December 2023 which is used as the base year. Please refer to the Integrated Annual Report for additional information on the methodology on our passenger cars portfolio.

Maritime transport

Deep sea shipping

For deep sea shipping, ABN AMRO uses the verified data submitted through the Poseidon Principles framework, however there is a one-year delay in reporting. In 2024 we adopted the Det Norske Veritas (DNV) 1.5°C trajectory (Scenario 10), as the previously used Poseidon Principles trajectories are not yet fully 1.5 °C -aligned. The climate strategy alignment delta for shipping in 2024 is -2%. The target is to be fully aligned with DNV 1.5°C trajectory (Scenario 10).

Inland freight water

For inland freight water transport (inland shipping) the intensity metric for Q4 2024 was 25.1 gCO₂/tkm, and is a slight decrease from Q2 2024 intensity of 26.6 gCO₂/tkm. This metric is based on average emissions intensity per ship size (small, medium and large). In the absence of a widely recognised benchmark for our inland shipping portfolio, we have chosen to adopt the IEA freight and shipping benchmark. This global benchmark aggregates the emissions intensity of maritime shipping and trucking, resulting in a relatively low emissions intensity baseline.

Agriculture

The agriculture portfolio utilised Dutch national averages to calculate the baseline and anticipated targets for 2030. The counterparty scope of Pillar 3 impacts the figures reported for the agriculture portfolio, as this partly consists of households, which are therefore excluded from reporting in this template. Consequently, the alignment metric value is impacted due to the calculation of financed emissions, resulting in a value lower than the target.

Commercial real estate

For commercial real estate, in Q4 2024 our portfolio emission intensity was 58.2 kgCO₂/m², which is a slight decrease from the Q2 2024 intensity of 61.9 kgCO₂/m². Underlying this performance is an increase in percentage of collateral with energy labels A or higher, and a decrease in percentage of collateral with energy labels D-G.

5 Agriculture	0113, 0125, 0128, 0130, 0141, 0142, 0146	2,796	1.2 mtCO ₂ e/mln EUR financed	2024	0% ⁷	1.6 mtCO ₂ e/mln EUR financed
6 Commercial Real Estate		8,039	58.2 kgCO ₂ /m ²	2024	63% ⁸	42.3 kgCO ₂ /m ²

1. Please refer to the Glossary of other sustainability terms in our Integrated Annual Report for the definitions of the sectors that are included.

2. For automotive and commercial real estate, the scope of the portfolio is determined by specific-purpose financing rather than by NACE code. In this way, we focus on the particular activity of the financed loan.

3. PiT distance to 2030 NZE2050 scenario in % (for each metric): Metric at reference year - (IEA scenario metric in 2030)/(IEA scenario metric in 2030)*100. Please note that this formula, prescribed by EBA's calculation guidance, differs from the formula used in the climate strategy disclosures presented in our IAR.

4. ABN AMRO has only set a 2030 target, therefore the figures reported in this column are based on linear targets.

5. This amount includes both the outstanding and undrawn loan amounts.

6. In 2024, responding to the IMO's revised strategy for net-zero emissions by 2050 and our commitment to the NZBA, we adopted the Det Norske Veritas (DNV) 1.5°C trajectory (Scenario 10) for the shipping sector.

7. Our agriculture target is based on the Dutch Coalition Accord.

8. For CRE, we utilize the Carbon Risk Real Estate Monitor (CRREM 1.5 NL V1) methodology. Although it is not an IEA scenario, it is aligned with a 1.5°C maximum global warming scenario.

9. For the passenger cars sector, the counterparty scope is not restricted to non-financial corporations, and the GCA encompasses all counterparties.

10. Our target slightly deviates from the IEA's NZE2050 to also include Scope 2 emissions.

4. ABN AMRO has only set a 2030 target, therefore the figures reported in this column are based on linear targets.

5. This amount includes both the outstanding and undrawn loan amounts.

6. For shipping, we make use of the Poseidon Principles (PP) methodology, which follows the 2018 Initial International Maritime Organization (IMO) GHG strategy. This is a global framework for financial institutions for assessing and disclosing the climate alignment of their shipping portfolio.

7. Our agriculture target is based on the Dutch Coalition Accord.

8. For CRE, we utilize the Carbon Risk Real Estate Monitor (CRREM 1.5 NL V1) methodology. Although it is not an IEA scenario, it is aligned with a 1.5°C maximum global warming scenario.

ESG4 - Banking book - Climate change transition risk: Exposures to top 20 carbon-intensive firms

This template has been reported using the list provided in the Carbon Majors Database from CDP1. We chose this source as it is a reputable source which provides a clear methodological explanation and it also includes Scope 3 GHG emissions data. For each counterparty included in the CDP list, the full group related to the counterparty has been assessed.

ESG5 - Banking book - Climate change physical risk: Exposures subject to physical risk

Physical risk in the context of this template refers to the financial impact of a changing climate. It is categorised as “acute” when it arises from extreme events, such as droughts, floods and storms, and “chronic” when it arises from progressive shifts, such as increasing temperatures and water stress. While impact from environmental degradation, such as air, water and land pollution, biodiversity loss and deforestation also qualifies as physical risk, it is not in scope of this disclosure. This report’s physical risk assessment considers six climate hazards (flooding, heat stress, hurricanes & typhoons, sea level rise, water stress and wildfires) in addition to buildings’ foundational risk due to drought. The hazards linked to chronic risk are heat stress, water stress, and foundational risks, while those linked to acute risk are flooding, hurricanes & typhoons, wildfires and sea level rise.

Compared to 30 June 2024, our exposure sensitive to impact from climate change events increased slightly, mainly due to methodology update for mortgages, while the total exposure decreased slightly. The majority of our portfolio is located in the Netherlands, which has varying degrees of sensitivity to the impact of flooding, sea level rise and water stress. Most of the Dutch collateral and counterparties in our portfolio are located in the Western part of the country, some of which are sensitive to flood risk depending on the proximity to rivers. The majority of our exposures in the West are in urban areas around Amsterdam and Rotterdam, which have lower sensitivity to physical risk, also because of the highly developed flood protection systems in these cities. The agriculture sector has a large share of exposure in the North and East relative to other sectors in our portfolio, resulting in higher sensitivity to chronic risk.

The next sections contain more details on the data sources and methodology used to arrive at the disclosed figures.

Methodology and Data Sources

Physical risk is categorised as acute when it arises from extreme events, such as droughts, floods, and storms. Physical risk is categorised as chronic when it arises from progressive shifts, such as increasing temperatures, water stress, biodiversity loss, and resource scarcity. The assessment of whether there is exposures to physical risk takes into account the location of counter parties and collateral, and the sector in which the counterparty operates. There are two layers of data: i) geographic physical risk data, and ii) sectors sensitivities for physical risk. Geographic physical risk data comes from: i) locations in the Netherlands collateralised by residential real estate, which contains information on flooding and wildfires from the Climate Impact Atlas (CIA) and information on foundation risks from the Kennis Centrum Aanpak Funderingsproblematiek; ii) other locations in the Netherlands, which includes flooding data from the CIA and information on wildfires, heat stress, water stress, hurricanes and typhoons and sea level rise from Moody's; iii) locations outside the Netherlands, which includes information on flooding, wildfires, heat stress, water stress, hurricanes and typhoons and sea level rise from Moody's. Foundation problems are an important driver of physical climate risk in the Dutch real estate sector. Sector sensitivities for physical risk are obtained from the Environmental and Social Risk Heatmap and are at NACE level 4. Examples of sector sensitivities include assessing flooding sensitivity based on dependency on physical assets and evaluating water stress sensitivity based on water dependence.

Hazard	Data Source		
	Loans in the Netherlands, collateralised by residential immovable property	Loans in the Netherlands, collateralised by commercial immovable property or not secured by immovable property	Loans outside the Netherlands
Flooding	Climate Impact Atlas	Climate Impact Atlas	Moody's ESG Solutions
Wild fire	Climate Impact Atlas	Moody's ESG Solutions	Moody's ESG Solutions
Heat stress		Moody's ESG Solutions	Moody's ESG Solutions
Water stress		Moody's ESG Solutions	Moody's ESG Solutions
Hurricanes & Typhoons		Moody's ESG Solutions	Moody's ESG Solutions
Sea level rise		Moody's ESG Solutions	Moody's ESG Solutions
Foundation risks	Kennis Centrum Aanpak Funderingsproblematiek		

The starting point of the physical risk assessment is the climate hazard exposure to a counterparty's geographical location or, when available, its collateral. The exposure is marked as sensitive to acute or chronic risk if the location is sensitive to one of the underlying hazards, as in Moody's ESG Solutions methodology. An alternative approach is used for Dutch flooding events: a Dutch exposure is classified as sensitive to acute risk if at least 10% of buildings in the NUTS region are exposed to flooding of more than half a metre.

ESG6 - Summary of GAR KPIs

	31 December 2024			
	KPI			% coverage (over total assets) ¹
	Climate change mitigation	Climate change adaptation	Total (Climate change mitigation + Climate change adaptation)	
GAR stock	11%	0%	11%	80%
GAR flow	23%	0%	23%	

1. % of assets covered by the KPI over banks' total assets.

The table requests the percentage of coverage over total assets for stock and flow. However, this calculation is not feasible for flow since the flow template only includes GAR assets. The total assets relevant to flow are not part of the template, which means they cannot be reported or used to determine the coverage percentage.

	30 June 2024			
	KPI			% coverage (over total assets) ¹
	Climate change mitigation	Climate change adaptation	Total (Climate change mitigation + Climate change adaptation)	
GAR stock	9%	0%	9%	81% ³
GAR flow ²				

1. % of assets covered by the KPI over banks' total assets.

2. The figures regarding EU Taxonomy Flow are left blank. We will start reporting this from Q4 2024 in order to ensure alignment with the approach taken for the EU Taxonomy disclosures in the Integrated Annual Report 2024.

3. The significant difference in the % coverage percentage is due to a change in the formula as a result of additional guidance. Last year in Q4 2023 we compared the alignment with the total assets. This year in Q2 2024 it is updated to covered assets compared with total assets.

	31 December 2023		
	KPI		% coverage (over total assets) ¹
	Climate change mitigation	Climate change adaptation	Total (Climate change mitigation + Climate change adaptation)
GAR stock	10%	0%	10%
GAR flow ²			8%

1. % of assets covered by the KPI over banks' total assets.

2. The figures regarding EU Taxonomy Flow are left blank. We will start reporting this from Q4 2024 in order to ensure alignment with the approach taken for the EU Taxonomy disclosures in the Integrated Annual Report 2024.

1. As there is no line item in the P3 template for exposures towards non-NFRD financial corporations, these exposures are included in the line item 'other assets'. The necessity for this is to reconcile with the EU Taxonomy where non-NFRD financial corporations are included in the disclosures as a separate line item. In order to reconcile with the EU Taxonomy disclosures, in the total 'Other financial corporations', exposures to financial corporations that are defined as such under the FINREP but are non-financial under EU Taxonomy, are taking into account. This additional category was created in the EU Taxonomy template to remain aligned with the finrep definition of a financial corporation while simultaneously remain in compliance with the EUT.
2. For household-related activities, the approach taken uses Climate Change Mitigation (CCM) eligibility as the primary measure of total eligibility. CCM encompasses the full scope of eligibility related to households, effectively capturing activities that are also eligible under Climate Change Adaptation (CCA) and Circular Economy (CE). This approach ensures a more precise depiction of eligibility and avoids double counting.
3. The household product loans collateralised by rip and renovation loans have been included in this year's assessment for Climate Change Adaptation, these were previously not in scope for this environmental objective. This change aligns with the recent update to the EU Taxonomy regulation, which has expanded the scope of these household products to include not only Climate Change Mitigation (CCM) but also Climate Change Adaptation (CCA).

1. As there is no line item in the P3 template for exposures towards non-NFRD financial corporations, these exposures are included in the line item 'other assets'. The necessity for this is to reconcile with the EU Taxonomy where non-NFRD financial corporations are included in the disclosures as a separate line item. In order to reconcile with the EU Taxonomy disclosures, in the total 'Other financial corporations', exposures to financial corporations that are defined as such under the FINREP but are non-financial under EU Taxonomy, are taken into account. This additional category was created in the EU Taxonomy template to remain aligned with the finrep definition of a financial corporation while simultaneously remain in compliance with the EUT.

2. For household-related activities, the approach taken uses Climate Change Mitigation (CCM) eligibility as the primary measure of total eligibility. CCM encompasses the full scope of eligibility related to households, effectively capturing activities that are also eligible under Climate Change Adaptation (CCA) and Circular Economy (CE). This approach ensures a more precise depiction of eligibility and avoids double counting.

3. The household product loans collateralised by rip and renovation loans have been included in this year's assessment for Climate Change Adaptation, these were previously not in scope for this environmental objective. This change aligns with the recent update to the EU Taxonomy regulation, which has expanded the scope of these household products to include not only Climate Change Mitigation (CCM) but also Climate Change Adaptation (CCA).

ESG10 - Other climate change mitigating actions not covered in the EU Taxonomy

This template includes other climate change mitigating actions that are not aligned with the strict criteria of the EU Taxonomy, but nevertheless support counterparties in mitigating climate change related risks.

As a reference, we used the loans that we internally label as 'acceleration' based on our Sustainability Acceleration Standard (SAS). Our SAS definition is based on current market practice for loans and investments, and is aligned with the definitions set in the EU SFDR regulation for client assets. The criteria in the SAS do not only relate to climate change, but can also relate to other environmental objectives or social objectives. As this template only focuses on climate, we have made a sub-selection of our SAS-aligned loans that specifically relate to climate change based on sub-categories in the standard. An example would be an acceleration finance loan used for clean transportation or sustainable real estate.

The exposures reported as at 31 December 2024 increased compared to 30 June 2024, mainly as a result of inflow stemming from new mortgage production (households loans).

We note that, considering the EU Taxonomy, a limited part of our exposures is aligned. This is mainly due to the limited scope and strict requirements of the EU Taxonomy as a result of the Technical Screening Criteria and the NFRD scope, among others. Therefore, the majority of exposures continue to be reported in this Pillar 3 template.
